

The company was founded in 1987 by transforming the former CSA, which was a trading company dealing with pipes and valves for water networks, into a manufacturing company, through the research and realization of pillar fire hydrants. Since then many other products have been added.

The history of our company is characterised by years of technical and commercial research, which have enabled us to offer a complete range of valves designed for controlling, regulating and protecting the pipelines under pressure in both waterworks and sewage lines as well as fire hydrants.

Our many industrial patents and innovative technical solutions, together with modern and attractive style of design, have made it possible to differentiate our products from those offered by competitors and have allowed us to become a point of reference in our sector.

Flexibility and reliability have been the key points of the rapid growth of CSA over the last few years. We are perfectly aware that we are managing the world's most precious resource and, motivated by this responsibility and the commitment towards our customers, we have dedicated ourselves to constantly improving our products, placing them at the highest levels of quality.

## Quality

In the manufacturing business today, quality is the fundamental requirement for achieving and maintaining a growing market share.

For this reason we have always aimed at developing a synergy between the various sectors of the company and thus ensuring:

- quick and precise answers;
  - evaluation of data received and immediate response;
  - rigorous control of incoming and outgoing products.
- Since 1998 CSA is certified according to regulation ISO 9001 by Rina (Italian Naval Registry) recently converted into ISO 9001/2008.

During the research and realisation of new products, CSA has always focused his efforts on:

- listening to the customer's needs and finding the best solution at the design and operational phases,
- guiding our R&D department to develop ranges of modern, reliable and complementary products,
- adopting production techniques that, even while complying with the severest quality standards, would allow us to reduce delivery times,
- guaranteeing complete technical support for our customers and prompt after-sales assistance.

This philosophy characterizes us not only as a valve manufacturer but also as a reliable partner whom you can always depend on for consulting and solutions.

The production cycle, aimed at the constant improvement of our products and complete customer satisfaction, ensures predetermined margins of tolerance by establishing production standards, which guarantee that the semi-finished products reach the next production stage with the required specifications. All our valves are made of ductile cast iron GJS 450-10 or 500-7 in absolute compliance with European standards, and are suitable for PN 25-40 bar.

The manufacturing process is carried out exclusively by means of numerically controlled lathes, mills, and horizontal machining units. Subsequent step-by-step controls are based on strict quality procedures.

Painting, pretreated by sand blasting grade SA 2.5, is carried out inside a fluidized bed containing epoxy powder, which guarantees maximum surface protection. All our products are tested under water pressure and certified.

**Automatic  
control valves  
XLC 300/400  
series**

# Automatic control valves XLC 300 and 400 series

## Overview:

Technical features	7
Operating principles	9
GRIFO flow control unit	10

## Main configurations:

### Pressure reducing series

■ Downstream pressure reducing stabilizing automatic control valve Mod. XLC 310/410	11
■ Downstream pressure reducing stabilizing valve with over pressure guard XLC 310/410-G	13
■ Downstream pressure reducing valve with two set points Mod. XLC 310/410-ND	15
■ Pressure management downstream pressure reducing valve Mod. XLC 310/410-ND-H	17
■ Pressure reducing valve with Bluetooth remote control, two set points XLC 310/410-ND-P	19
■ Pressure management automatic control valve Mod. XLC 310/410-T	21
■ Downstream pressure reducing and upstream pressure sustaining valve Mod. XLC 312/412	23
■ Downstream pressure reducing stabilizing valve with solenoid control Mod. XLC 315/415	25

### Pressure sustaining/relief series

■ Upstream pressure sustaining automatic valve Mod. XLC 320/420-S	27
■ Upstream pressure relief automatic valve Mod. XLC 320/420-R	29
■ Upstream pressure relief surge anticipating control valve Mod. XLC 321/421	31
■ Upstream pressure sustaining level control valve Mod. XLC 324/424	33
■ Upstream pressure sustaining valve with solenoid control Mod. XLC 325/425	35
■ Upstream pressure sustaining constant level control valve Mod. XLC 326/426	37
■ Differential pressure sustaining valve Mod. XLC 395/495	39

## Flow rate control series

- Flow rate automatic control valve Mod. XLC 330/430 41
- Flow control and pressure reducing automatic valve Mod. XLC 331/431 43
- Flow regulation valve with minimum-maximum level control Mod. XLC 334/434 45
- Flow automatic control valve with solenoid control Mod. XLC 335/435 47
- Burst automatic control valve Mod. XLC 380/480 49

## Level control series

- Minimum-maximum level automatic control valve Mod. XLC 340/440 51
- Constant level automatic control valve Mod. XLC 360/460 - MCP 53
- Constant level automatic control valve Mod. XLC 360/460 - Rotoway 55
- Constant level control valve with on-off solenoid control Mod. XLC 365/465 - MCP 57
- High sensitivity altitude automatic control valve Mod. XLC 370/470 59
- High sensitivity altitude control valve with two set points Mod. XLC 370/470-D 61

## Electronic control series

- On-off solenoid automatic control valve Mod. XLC 350/450 63
- On-off solenoid control battery operated flush valve Mod. XLC 350/450-P 65
- Step by step solenoid control valve Mod. XLC 353/453 67
- Booster pump automatic control valve Mod. XLC 390/490 69
- Booster pump control and pressure sustaining valve Mod. XLC 392/492 71

## **XLC valves pilots and accessories:**

■ Direct acting pressure reducing-stabilizing valve Mod. Microstab MRV	73
■ Direct acting pressure reducing-stabilizing valve Mod. Microstab MRV 2	74
■ Direct acting pressure sustaining valve Mod. Microstab MSM	75
■ Direct acting quick pressure relief valve Mod. Microstab PSM	76
■ Flow control valve Mod. Microstab MLP	77
■ High sensitivity altitude/pressure reduction pilot Mod. Microstab MPZ	78
■ Two and three ways flow accelerators Mod. A2 and A3	79
■ Visual position indicator Mod. CSPV	80
■ On-off position transmitter assembly Mod. CSPO	81
■ Contactless linear position transducer with magnetostrictive technology Mod. CSPL	82
■ Three ways on-off level vertical float for minimum and maximum tank regulation Mod. Rotoway	83
■ Two ways modulating proportional constant level control pilot Mod. MCP	84
■ On-off limit switch assembly Mod. CSLS	85
■ Mechanical flow regulator Mod. CSFL	86

## **Technical and sizing:**

XLC 300 - Standard and anti-cavitation versions	95

## **Double chamber control valves XLC DC series:**

Technical features and operating principles	103
■ Double chamber proportional pressure reducing valve XLC 300/400-DC-PR	105
■ Double chamber downstream pressure reducing stabilizing valve Mod. XLC 310/410-DC	107
■ Double chamber upstream pressure sustaining valve Mod. XLC 320/420-S-DC	109
Technical details	111

## Automatic control valves XLC 300 and 400 series

The CSA XLC range consist of a globe pattern hydraulically operated automatic control valves, namely 400 for the full bore and 300 for the reduced bore series, entirely produced in ductile cast iron with internal components in stainless steel.

Diaphragm actuated PN 25 class, the valve is designed to perform a tremendous range of applications including pressure reduction, relief, sustain, flow control, level control and many more. Each function is obtained simply by changing the circuitry and pilots, that can be combined together.

All information herewith contained referring to operating principle, case studies and installation guidelines, are applicable to the XLC 300 and 400 series unless otherwise stated.

**XLC 300 series**

**XLC 400 series**

### Technical features and benefits

- Body in ductile cast iron, PN 25 bar rated, globe pattern design in compliance with EN 1074 standards and available from DN 50 mm up to DN 600 mm.
- Designed to reduced head loss and minimize turbulence under a wide flow range.
- Double chambered actuator as an option.
- Stainless steel seat and mobile block assembly entirely removable from the valve.
- Silent operation and absence of vibrations, suitable for buildings and urban applications.
- Technology to reduce the risk of diaphragm failure, the latter manufactured with nylon reinforced fabric.
- Different versions of the modulating assembly, more in details the seat and the gasket holder, to provide excellent resistance to cavitation, low flow stability and obstacle free design.
- In-line serviceable from the top with having to remove the valve from the pipe.
- High quality materials and reliability for long lasting performances with internals all made in stainless steel, obturator and wedge in ductile cast iron for large diameters.

### Applications

- Main transmission lines and water distribution networks.
- Industrial plants.
- Cooling system.
- High-rise buildings.

## Technical features

The mobile block includes the obturator, upper flat, diaphragm, shaft and gasket holder, the latter engineered with different versions to guarantee the maximum accuracy and best performances in accordance to the results of the sizing and to the design requirements.

### Standard version of gasket holder and sealing seat

On the standard version the shaft is guided in two points, through the cap and the seat, moving frictionless during modulation. The gasket holder (1a) is machined with a fillet whose radius reduces the risk of hunting at small opening percentage.

### LF version for low flow stability

The LF includes a gasket holder (1b) with progressive opening allows for stability also in presence of extreme low flow values. Once the opening percentage has increased above the LF system operating range the valve will open completely, ensuring the minimum energy dissipation thanks to unobstructed flow pattern.

### AC version for low flow stability and cavitation prevention

The anti-cavitation trim AC mobile block includes a gasket holder (1c) designed to increase the allowable pressure ratio and resistance to cavitation, improving at the same time the valve's stability to guarantee the maximum accuracy also in case of no flow.

### CP anti-cavitation version

The CP system includes two cages (1d, 2d) for double energy dissipation between inlet and outlet, whose holes can be customized according to the project in hand and required performances, this is to avoid damages to the valve without a drastic reduction of the valve's Kv.

## Operating principle on-off mode

### Valve opening

If the pressure inside the control chamber is put in communication with the atmosphere or some other lower pressure zone, the upstream pressure will act on the obturator, pushing it upwards allowing the complete opening of the valve.

### Valve isolated from the line

Should the control chamber be isolated from the line pressure and the rest of the circuitry the valve will remain in the same position, therefore producing the head loss corresponding to such opening percentage.

### Valve closing

If the control chamber is put in communication with the upstream pressure, thanks to the difference in area between the upper flat with diaphragm, larger than the obturator underneath, the valve will close completely.

## Operating principle modulating mode

### Valve opening

When the main valve is required to modulate a restriction (R) is needed between the upstream line pressure and the control chamber, in addition to a regulator (F) on the circuit. Should the latter open completely pressure inside the control chamber will be put in communication with downstream, allowing for the full opening of the main valve.

### Valve modulating

If the flow regulator (F) is throttled pressure will build up between it and the control chamber, causing the valve to modulate accordingly to an intermediate position. This is obtained thanks to the pressure difference created by the restriction (R) and to the difference in section between the upper flat acting on the diaphragm and the obturator.

### Valve closing

Should the flow regulator (F) be completely closed, the upstream line pressure is all diverted to the main control chamber. The mobile block is moved by the force exerted on the upper diaphragm flat pushing the obturator down onto the seat, interrupting the flow through the main valve.

## GR.I.F.O. 3/8" PN 25 flow control device

The CSA exclusive unit flow control device with built-in filter GR.I.F.O. (patent pending) has been designed to enhance flow stability and accuracy on CSA hydraulic control valves XLC series thanks to a combination of adjustable needle valves and check valves. Entirely built in stainless steel, impervious to corrosion, compact and provided with several pressure ports, GR.I.F.O. allows for a tremendous range of regulation reducing at the same time the complexity of the circuit compared to the other solutions available on the market. GR.I.F.O. is composed of the following: a filter, with fine mesh in stainless steel AISI 316, to protect the hydraulic circuitry from possible dirt; three adjustable needle flow stabilizers valves in stainless steel with check valves, needed for the regulation of the main valve's response time, opening and closing speed that remain independent one from the other; filtered and unfiltered pressure ports.

## Operating principle modulating mode - example of pressure reduction

### Valve opening

Should the downstream pressure drop below the pilot's (P) preset and adjustable set point the latter will open, allowing flow and pressure to be relieved out of the main chamber. The mobile block will be lifted increasing the passage between the obturator and the seat trying to re-establish the desired downstream pressure value.

### Valve modulating

As a consequence of gradual change in demands the pilot (P) will keep regulating the flow in and out of the main chamber to compensate for pressure variations. The mobile block will reproduce the pilot's movement, throttling the passage between the seat and obturator to produce the head-loss required for the pressure reduction.

### Valve closing

Should the downstream pressure rise above the pilot's (P) set point the latter will close, allowing pressure to be built up inside the main chamber. The mobile block will be pushed down trying to restore the desired downstream value. In case of static conditions pilot will be fully closed with the valve maintaining the downstream pressure.

## Downstream pressure reducing stabilizing automatic control valve **Mod. XLC 310/410**

The CSA model XLC 310/410 is a globe pattern hydraulically operated automatic control valve that reduces and stabilizes the downstream pressure to a constant value, regardless of variation in demands and upstream pressure conditions. Normally equipped with visual position indicator and entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage. The CSA pressure reducing stabilizing valve XLC 310/410 is extremely versatile and can be used for a wide range of applications.

### Applications

- Downstream of pumps to reduce the pressure on the main supply line.
- Installed in derivation from the main line to stabilize the pressure of secondary line and water users.
- As a protection against rise in pressure of industrial equipment and civil installations.
- On the inlet supply line of storage tanks to stabilize pressure and flow required for the level control.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet and outlet pressure, and flow rate are required for the proper sizing.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- A minimum length of 3 DN downstream of the valve is recommended for the best accuracy.

### Additional features

- XLC 310/410-FR downstream pressure reducing with back-flow prevention.
- XLC 310/410-H downstream pressure reducing with high sensitivity pilot.
- XLC 310/410-G downstream pressure reducing with over pressure guard.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 25 bar.
- Maximum temperature: 70°C.

### Downstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.
- Higher values up to 25 bar on request.
- Values lower than 0,7 available with high sensitivity pilots.

## Operating principle

The CSA model XLC 310/410 is an automatic control valve operated by a 2 ways pilot (5) with pre-set set and adjustable value. Should the downstream pressure rise above the pilot set point the latter will throttle and limit the flow to direct inlet pressure to the main chamber (10), thus pushing down the obturator (11) to generate the head loss required for the valve (9) to reduce and stabilize the downstream pressure to a constant value. Should the downstream pressure fall below the pilot set point the obturator (11) will raise increasing the passage through the seat (12), thus reducing the head loss followed by the rise in pressure. The flow in and out of the main chamber (10) is controlled by the CSA unit regulation device with filter GR.I.F.O. (4) provided with three needle valves and flow stabilizers, needed for the valve's response time and accuracy also in case of rapid variation in demand. Thanks to the isolation ball valves (1-2-3) the control circuit and its components can be maintained without interrupting the flow through the main line.

## Installation layout

The XLC 310/410 installation lay-out includes sectioning devices (1, 2) and by-pass for maintenance operations, and a filter (3) to prevent dirt from reaching the control valve. The direct acting pressure reducer VRCD (4) is the best choice on the by-pass thanks to its reliability also after long periods of inactivity. Anti-surge combination air valves FOX 3F AS (6, 7) are recommended upstream and downstream as well as a pressure relief valve VSM (5) to prevent rise in pressure on the main line.

## Downstream pressure reducing stabilizing valve with over pressure guard Mod. XLC 310/410-G

The CSA model XLC 310/410-G is a globe pattern hydraulically operated automatic control valve that reduces and stabilizes the downstream pressure to a constant value, regardless of variation in demands and upstream pressure conditions. Equipped with an additional pilot the valve will make sure to maintain the downstream pressure within the required set point without any unwanted increase and consequent damages to the system. Entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- Downstream of pumps to reduce the pressure on the main supply line.
- Installed in derivation from the main line to stabilize the pressure of secondary line and water users.
- As a protection against rise in pressure of industrial equipment and civil installations.
- On the inlet supply line of storage tanks to stabilize pressure and flow required for the level control.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- A minimum length of 3 DN downstream of the valve is recommended for the best accuracy.
- The set point value of the pressure guard pilot should remain within 0,6 bar tolerance on the PRV value.

### Additional features

- XLC 310/410-FR downstream pressure reducing with back-flow prevention.
- XLC 310/410-H downstream pressure reducing with high sensitivity pilot.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 25 bar.
- Maximum temperature: 70°C.

### Downstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.
- Higher values up to 25 bar on request.
- Values lower than 0,7 available with high sensitivity pilots.

### Over pressure guard pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.
- Values lower than 0,7 available with high sensitivity pilots.

## Operating principle

The CSA model XLC 310/410-G is an automatic control valve operated by a 2 ways pilot (5) for pressure reduction with pre-set set and adjustable value. Should the downstream pressure rise above the pilot set point the latter will throttle and limit the flow to direct inlet pressure to the main chamber (10), thus pushing down the obturator (11) to generate the head loss required for the valve (9) to reduce and stabilize the downstream pressure to a constant value. Should the downstream pressure fall below the pilot set point the obturator (11) will raise increasing the passage through the seat (12), thus reducing the head loss followed by the rise in pressure. The pressure guard pilot (13) senses the variation of the downstream pressure, should the latter rise above the set point the pilot (13) will open diverting the flow towards the control chamber, thus preventing any possible pressure increase above the PRV pilot (5) set point value. Thanks to the isolation ball valves (1-2-3) the control circuit and its components can be maintained without interrupting the flow through the main line.

## Installation layout

The XLC 310/410-G installation lay-out includes sectioning devices (1, 2) and by-pass for maintenance operations, and a filter (3) to prevent dirt from reaching the control valve. The pressure reducer VRCD (4) is the best choice on the by-pass thanks to its reliability also after long periods of inactivity. Anti-surge combination air valves FOX 3F AS (6, 7) are recommended upstream and downstream as well as a pressure relief valve VSM (5) as a back up to prevent rise in pressure on the main line.

## Downstream pressure reducing valve with two set points Mod. XLC 310/410-ND

The CSA model XLC 310/410-ND is a globe pattern hydraulically operated automatic control valve that reduces and stabilizes the downstream pressure to two pre-set and adjustable values, regardless of variation in demands and upstream pressure conditions, usually corresponding to night and day regulation. Normally equipped with visual position indicator, the valve is designed to reduce head loss, throttling noise and cavitation damage. The CSA pressure reducing valve XLC 310/410-ND is extremely versatile and mainly used for pressure management and water loss reduction campaigns.

### Applications

- A well-planned pressure management program will extend the life of the system increasing safety and reliability. The automatic control valve CSA XLC Model. 310/410-ND, thanks to the battery operated programmer, is designed to automatically optimize the downstream pressure regulations in two steps, both adjustable, where the lower values usually corresponds to night time low consumption requirements.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- A minimum length of 3 DN downstream of the valve is recommended for the best accuracy.
- The programmer is battery operated with an average lifespan of 13 months if used on a daily basis, different solutions on request.

### Additional features

- XLC 310/410-ND-FR night and day downstream pressure reduction with back-flow prevention.
- XLC 310/410-ND-H night and day downstream pressure reduction with high sensitivity pilot.
- XLC 310/410-ND-5 night and day downstream pressure reduction with solenoid control.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 16 bar.
- Maximum temperature: 70°C.

### Downstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.

## Operating principle

The valve is operated by two 2 ways pilot (5-16), for pressure reduction with pre-set set and adjustable values, activated by a battery operated timer (15) acting on a flow accelerator (14). During night time regulation (low pressure) pilot 5 is working being the two ways valve (14) closed. Should the downstream pressure rise above the pilot (5) set point the latter will throttle and limit the flow to direct inlet pressure to the main chamber (10), to generate the head loss required for the valve (9) to reduce and stabilize the downstream pressure. During the day, or according to the customer's program of the timer (15), the pilot (16) is activated, and being its set point higher than the night time pilot (5) the latter will be forced to the closed position. The flow in and out of the main chamber (10) is controlled by the CSA exclusive unit regulation device with filter called GR.I.F.O. (4) and provided with three needle valves and flow stabilizers, needed for the valve's response time and accuracy also in case of rapid variation in demand.

## Installation layout

The recommended XLC 310/410-ND installation lay-out includes sectioning devices (1, 2) and by-pass for maintenance operations, and a filter (3) to prevent dirt from reaching the control valve. The direct acting pressure reducer VRCD (4) is the best choice on the by-pass thanks to its reliability also after long periods of inactivity. Anti-surge combination air valves FOX 3F AS (6, 7) are recommended upstream and downstream as well as a pressure relief valve VSM (5) to prevent rise in pressure on the line.

## Pressure management downstream pressure reducing valve **Mod. XLC 310/410-ND-H**

The CSA model XLC 310/410-ND-H is a globe pattern hydraulically operated automatic control valve that reduces and stabilizes the downstream pressure to two pre-set and adjustable values, regardless of variation in demands and upstream pressure conditions, usually corresponding to night and day regulation. Designed to reduce head loss, throttling noise and cavitation damage the valve switches from one pressure to the other according to the flow rate, within an adjustable range. XLC 310/410-ND-H is extremely versatile and mainly used for pressure management and water loss reduction campaigns.

### Applications

- A well-planned pressure management program will extend the life of the system increasing safety and reliability. The automatic control valve CSA XLC Model 310/410-ND-H, thanks to high sensitivity pilots, is designed to automatically perform the downstream pressure regulations in two values, both adjustable, where the lower values usually corresponds to night time low consumption requirements.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- CSA anti-cavitation low flow stability plugs are recommended in case of low flow.
- A minimum length of 3 DN downstream of the valve is recommended for the best accuracy.
- The flow rate switching point, from one downstream pressure value to the other, is adjusted through an high sensitivity pilot on a scale provided according to the application.

### Additional features

- XLC 310/410-ND-H-FR night and day pressure reduction with back-flow prevention.
- XLC 310/410-ND-H-H night and day downstream pressure reduction with high sensitivity pilot.
- XLC 310/410-ND-H-5 night and day downstream pressure reduction with solenoid control.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 16 bar.
- Maximum temperature: 70°C.

### Downstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.

## Operating principle

The valve is operated by two 2 ways pilot (5-16), for pressure reduction with pre-set set and adjustable values, activated by a third high accuracy flow sensing pilot (14), connected to a flanged orifice assembly located upstream (15). The flanged orifice is sized according to the application, user can then operate on the regulation screw to determine the flow above which the high pressure pilot will begin to work. Should it remain below such point the pilot (14) is closed diverting all flow and pressure to operate the lower pressure pilot (5). Once the flow has reached the triggering point pilot (14) will open allowing flow to circulate through the pilot (16), which will increase the pressure on the downstream side of the valve by closing the pilot (5), set to a lower value. The flow in and out of the main chamber (10) is controlled by the CSA exclusive unit regulation device with filter called GR.I.F.O. (4) provided with three needle valves and flow stabilizers, needed for the valve's response time and accuracy also in case of rapid variation in demand.

## Installation layout

The recommended XLC 310/410-ND-H installation lay-out includes sectioning devices (1, 2) and by-pass for maintenance operations, and a filter (3) to prevent dirt from reaching the control valve. The direct acting pressure reducer VRCD (4) is the best choice on the by-pass thanks to its reliability also after long periods of inactivity. Anti-surge combination air valves FOX 3F AS (6, 7) are recommended upstream and downstream as well as a pressure relief valve VSM (5) to prevent rise in pressure on the line.

## Pressure reducing valve with Bluetooth remote control and two set points **Mod. XLC 310/410-ND-P**

The CSA model XLC 310/410-ND-P is a globe pattern hydraulically operated automatic control valve that reduces and stabilizes the downstream pressure to two pre-set and adjustable values, regardless of variation in demands and upstream pressure conditions, usually corresponding to night and day regulation. Equipped with a Bluetooth remotely controlled programmer with EP68 case, and designed to reduce head loss, throttling noise and cavitation damage, the CSA pressure reducing valve XLC 310/410-ND-P is extremely versatile and mainly used for pressure management and water loss reduction campaigns.

### Applications

- A well-planned pressure management program will extend the life of the system increasing safety and reliability. The automatic control valve CSA XLC model 310/410-ND-P, thanks to the battery operated programmer EP68, managed by an intuitive app, is designed to automatically optimize the downstream pressure regulations in two steps, both adjustable, without having to access the location and controlled remotely.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- CSA anti-cavitation low flow stability plugs are recommended in case of low flow.
- A minimum length of 3 DN downstream of the valve is recommended for the best accuracy.
- The programmer is battery operated with a Bluetooth and user friendly interface, different configurations and customized solutions available on request.

### Additional features

- XLC 310/410-ND-P-FR night and day pressure reduction with back-flow prevention.
- XLC 310/410-ND-P-H night and day downstream pressure reduction with high sensitivity pilot.
- XLC 310/410-ND-P-5 night and day downstream pressure reduction with solenoid control.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 16 bar.
- Maximum temperature: 70°C.

### Downstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.

## Operating principle

The valve is operated by two 2 ways pilot (5-16), for pressure reduction with pre-set set and adjustable values, activated by a control unit (15) acting on a flow accelerator (14). During night time regulation (low pressure) pilot 5 is working with the flow accelerator (14) in the closed position. Should the downstream pressure rise above the pilot (5) set point the latter will throttle and limit the flow to direct inlet pressure to the main chamber (10), to generate the head loss required for the valve (9) to reduce and stabilize the downstream pressure. During the day, or according to the customer's program of the unit (15), the pilot (16) is activated, and being its set point higher than the night time pilot (5) the latter will be forced to the closed position. The flow in and out of the main chamber (10) is controlled by the CSA exclusive unit regulation device with filter called GR.I.F.O. (4) and provided with three needle valves and flow stabilizers, needed for the valve's response time and accuracy also in case of rapid variation in demand.

## Installation layout

The recommended XLC 310/410-ND-P installation lay-out includes sectioning devices (1, 2) and by-pass for maintenance operations, and a filter (3) to prevent dirt from reaching the control valve. The direct acting pressure reducer VRCD (4) is the best choice on the by-pass thanks to its reliability also after long periods of inactivity. Anti-surge combination air valves FOX 3F AS (6, 7) are recommended upstream and downstream as well as a pressure relief valve VSM (5) to prevent rise in pressure on the line.

## Pressure management automatic control valve Mod. XLC 310/410-T

The CSA model XLC 310/410-T automatic control valve reduces and stabilizes the downstream pressure correlating the pilot setting with demand, regardless of changes and fluctuations of upstream pressure conditions, through signals supplied by a CSA controller or existing PLC either using a web interface or battery operated solutions. The CSA pressure reducing stabilizing valve XLC 310/410-T stands out as the ideal solution for pressure management, and water loss reduction, as it can be interfaced with any existing SCADA and remote control system in addition to pressure sensors installed at the critical nodes and supply inlets.

### Applications

- A well-planned pressure management program will extend the life of the system increasing safety and reliability. The CSA XLC 310/410-T is designed to automatically optimize the downstream pressure with a real time adjustment as a function of demand, flow rate and pressure values at the critical nodes, obtained with CSA controllers and web interface. Setting can be easily changed from remote from any portable device with a powerful and intuitive programming interface.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Available with several CSA controllers namely DC1, DC2, DC3 designed to be either power supplied to guarantee real time communication through web interface, or provided with battery and if required turbines, depending on the project requirements and the level of informations exchanged back and forth to the valve.

### Additional features

- XLC 310/410-T-FR pressure management valve with back-flow prevention.
- XLC 310/410-T-H pressure management valve with high sensitivity pilot.
- XLC 310/410-T-5 pressure management valve with solenoid control.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 16 bar.
- Maximum temperature: 70°C.

### Downstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.
- Values lower than 0,7 available with high sensitivity pilots.

## Operating principle

The CSA model XLC 310/410-T is an automatic control valve operated by a 2 ways pilot (5) whose cover receives pressure from a secondary line, onto which two solenoids (13 and 16) are acting through signals from a CSA controller linked to flow and pressure measurement devices. The purpose of this valve is to change the downstream pressure reduction set-point according to a flow rate curve that can be modified. Therefore should the system require an increase of the downstream pressure value the solenoid (13) will open in response to an impulse, vice-versa the 16 will decrease it by discharging pressure into atmosphere.

Needle valves (14, 17) and the buffer (15) are required to throttle the flow and improve the valve's stability. The flow in and out of the main chamber (10) is controlled by the CSA exclusive unit regulation device with filter called G.R.I.F.O. (4) and provided with three needle valves and flow stabilizers, needed for the valve's response time and accuracy also in case of rapid variation in demand.

## Installation layout

In the following installation lay-out the CSA valve XLC 310/410-T (1) receives impulses from the CSA controller (2), either power supplied or battery operated, working in combination with flow rate (3) and pressure measurement (4) devices (located near the valve or on critical points of the networks). Anti-surge combination air valves FOX 3F AS (6, 7) are recommended upstream and downstream as well as a pressure relief valve, like CSA direct acting model VSM (5) to prevent rise in pressure on the main line.

## Downstream pressure reducing and upstream pressure sustaining valve Mod. XLC 312/412

The CSA Model XLC 312/412 is a globe pattern hydraulically operated automatic control valve with two independent functions. It sustains the upstream pressure to a minimum and pre-set value regardless of changes in demand, and it prevents at the same time the downstream pressure from rising above a maximum set-point. Both values are adjustable. Normally equipped with visual position indicator and made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- Downstream of pumps to reduce pressure on the supply line and to prevent pump overload.
- To stabilize the pressure of secondary lines and avoid possible depressurization of the main transmission pipe.
- On gravity fed transmission lines to ensure a minimum operating pressure to consumers located upstream, preventing downstream pressure from rising above critical values in case of low consumption.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet and outlet pressure, flow rate are required for the proper sizing.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- A minimum length of 3 DN downstream and upstream of the valve is recommended for the best accuracy.

### Additional features

- XLC 312/412-FR upstream pressure sustaining and downstream pressure reduction valve with back-flow prevention.
- XLC 312/412-H upstream pressure sustaining and downstream pressure reduction valve with high sensitivity pilot.
- XLC 312/412-5 upstream pressure sustaining and downstream pressure reduction valve with solenoid control.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 25 bar.
- Maximum temperature: 70°C.

### Downstream and upstream pilots range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar
- Higher values up to 25 bar on request.
- For the pressure reduction pilot values lower than 0,7 available with high sensitivity pilots.

## Operating principle

The CSA model XLC 312/412 is an automatic control valve operated by two 2 ways pilots, respectively for the upstream pressure sustaining (13) and the downstream pressure reduction, (5) both with pre-set set and adjustable value. Should the upstream pressure fall below the master pilot's (13) set point the latter will throttle and limit the flow to direct inlet pressure to the main chamber (10), to sustain and stabilize the upstream pressure to a constant value. Should the upstream pressure be higher than the pilot's (13) set point the latter will open, allowing flow through the main valve (9) where at this point the pilot (5) will control and maintain the required downstream pressure. The flow in and out of the main chamber (10) is controlled by the CSA exclusive unit regulation device with filter called GR.I.F.O. (4) and provided with three needle valves and flow stabilizers, needed for the valve's response time and accuracy also in case of rapid variation in demand.

## Installation layout

The XLC 312/412 installation lay-out includes sectioning devices (1, 2) and by-pass for maintenance, and a filter (3) to prevent dirt from reaching the control valve. The direct acting pressure sustaining VSM (8) and reducer VRCD (4) are the best choice on the by-pass thanks to their reliability also after long periods of inactivity. Anti-surge combination air valves FOX 3F AS (6, 7) are recommended upstream and downstream as well as an additional pressure relief valve VSM (5) to prevent rise in pressure on the line.

## Downstream pressure reducing stabilizing valve with solenoid control Mod. XLC 315/415

The CSA model XLC 315/415 is a globe pattern hydraulically operated automatic control valve that reduces and stabilizes the downstream pressure to a constant value, regardless of variation in demands and upstream pressure conditions. Thanks to a solenoid control the valve will also open or close in response to a signal. Normally equipped with visual position indicator and entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- On the by-pass line of storage tank to ensure the required water supply and pressure control during maintenance.
- As a protection against rise in pressure of industrial equipments and civil installation with on-off control from remote for alarms and emergencies.
- Energy saving with controlled pumping and water supply hours.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet pressure, outlet pressure, flow rate and application are required for the proper sizing and cavitation analysis.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- A minimum length of 3 DN downstream of the valve is recommended for the best accuracy.

### Additional features

- XLC 315/415-FR downstream pressure reduction valve with solenoid control and back-flow prevention system.
- XLC 315/415-H downstream pressure reduction and solenoid control with high sensitivity pilot.
- XLC 315/415-G downstream pressure reduction valve with solenoid control and over pressure guard system.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 16 bar. Higher on request.
- Maximum temperature: 70°C.

### Downstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar
- Values lower than 0,7 available with high sensitivity pilots.

### Solenoid electrical data

- Voltages: 24 V DC, 24 V/50 Hz, 230 V/50 Hz. Other voltages on request.
- Power consumption: inrush AC (VA) 24, hold AC (VA) 17 (8 W), DC hot/cold coil 8/9 W.

## Operating principle

The CSA Model. XLC 315/415 is an automatic control valve operated by a two ways pilot (5), for downstream pressure reduction with pre-set adjustable value, and a solenoid valve (14) acting on a flow accelerator (13) to allow for normally open or normally closed function. Should the impulse to the solenoid (14) be set to have the flow accelerator (13) open if the downstream pressure rises above the pilot's set point (5) the latter will throttle, and limit the flow to divert line pressure to the main chamber (10), this to move the obturator down and generate the head loss required for the valve (9) to stabilize and maintain the desired downstream pressure. Should the downstream pressure fall below the pilot set point the obturator (11) will raise increasing the passage through the seat (12), reducing the head loss followed by the rise in pressure. The flow in and out of the main chamber (10) is controlled by the CSA exclusive unit regulation device with filter called GR.I.F.O. (4) and provided with three flow stabilizers, needed for the valve's response time and accuracy.

## Installation layout

Sectioning devices (1, 2) and by-pass are very important for maintenance operations, as well as the filter (3) to prevent dirt from reaching the control valve. The valve is receiving impulses to the solenoid from a CSA controller (8) or a remote signal. The direct acting pressure reducer VRCD (4) is the best choice on the by-pass thanks to its reliability also after long periods of inactivity. Anti-surge air valves FOX 3F AS (6, 7) are recommended as well as a pressure relief valve VSM (5), to prevent rise in pressure on the line.

## Upstream pressure sustaining automatic valve Mod. XLC 320/420-S

The CSA Model XLC 320/420-S is a globe pattern hydraulically operated automatic control valve that, installed in-line, will sustain the upstream pressure to a pre-set and adjustable value regardless of variations in demand. Normally equipped with visual position indicator and entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage. The XLC 320/420-S is extremely versatile and can be used for a wide range of applications in combination with several CSA accessories and additional functions.

### Applications

- Downstream of pumps to prevent overload and for cavitation protection.
- On the inlet supply line of storage tanks to stabilize pressure and flow required for the level control.
- On gravity fed supply lines to ensure the minimum pressure to consumers located at higher elevation zones, in case of high consumption of the lower zones.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet pressure, outlet pressure, flow rate and application are required for the proper sizing and cavitation analysis.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- A minimum length of 3 DN upstream of the valve is recommended for the best accuracy.

### Additional features

- XLC 320/420-S-FR pressure sustaining valve with back-flow prevention.
- XLC 320/420-S-5 pressure sustaining valve with solenoid control.
- XLC 320/420-S-H pressure sustaining valve with high sensitivity pilot.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 25 bar.
- Maximum temperature: 70°C.

### Upstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.
- Higher values up to 25 bar on request.

## Operating principle

The CSA Model XLC 320/420-S is an automatic control valve operated by a high sensitivity two ways pilot (5), with pre-set and adjustable set point value, sensing the upstream pressure from the G.R.I.F.O. (4). Should the line pressure rise above the pilot's set point the latter will open thus relieving the chamber (10) and moving the obturator (11) upwards, to discharge water and pressure through the main valve (9) downstream protecting the system. Should the upstream pressure be lower than the pilot's set point the latter will throttle (close eventually) diverting all pressure towards the main chamber (10) thus pushing the obturator (11) onto the seat (12), interrupting the flow rate.

The flow in and out of the main chamber is controlled by the CSA exclusive unit flow GR.I.F.O. (4) providing accuracy and absence of unwanted chattering.

## Installation layout

The recommended installation lay-out of the CSA XLC 320/420-S, used as a pressure sustain in-line, includes sectioning devices (1, 2) and by-pass for maintenance operations, and a filter (3) to prevent dirt from reaching the control valve. The direct acting pressure sustain valve CSA Mod. VSM (4) is the best choice on the by-pass thanks to its reliability also after long periods of inactivity. Anti-surge combination air valves CSA Mod. FOX 3F AS (5, 6) are recommended upstream and downstream of the installation.

## Upstream pressure relief automatic valve Mod. XLC 320/420-R

The CSA Model XLC 320/420-R is a globe pattern hydraulically operated automatic control valve that, installed in derivation from the main line, will relieve the excessive upstream pressure when it rises above the pre-set and adjustable value. Normally equipped with visual position indicator and entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage. The CSA pressure relief valve XLC 320/420-R is extremely versatile and can be used for a wide range of applications in combination with several CSA accessories and additional functions.

### Applications

- Downstream of pumps to protect the pipeline against rise in pressure during pump start up and pump failure.
- As a protection against rise in pressure in industrial equipment and civil installations.
- Downstream of pressure reducing station and modulating devices to protect the system against unwanted pressure fluctuations.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet pressure, outlet pressure, flow rate and application are required for the proper sizing and cavitation analysis.
- For the recommended flow rate, and operating conditions, please use the charts available on the XLC series engineering.
- When the valve discharges to atmosphere the AC (anti-cavitation) system is advised.

### Additional features

- XLC 320/420-R-FR upstream pressure relief valve with back-flow prevention.
- XLC 320/420-R-5 upstream pressure relief valve with solenoid control.
- The valve can be supplied without the GR.I.F.O. to increase the reaction time.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 25 bar.
- Maximum temperature: 70°C.

### Pressure relief pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.
- Higher values up to 25 bar on request.

## Operating principle

The CSA Model XLC 320/420-R is an automatic control valve operated by a high flow capacity two ways pilot (5), with pre-set and adjustable set point value, sensing the upstream pressure from the GR.I.F.O. (4). Should the line pressure rise above the pilot's set point the latter will open thus relieving the chamber (10) and moving the obturator (11) upwards, to discharge water and pressure through the main valve (9) downstream protecting the system. Should the upstream pressure be lower than the pilot's set point the latter will throttle (close eventually) diverting all pressure towards the main chamber (10) thus pushing the obturator (11) onto the seat (12), interrupting the flow rate.

The flow in and out of the main chamber is controlled by the CSA exclusive unit flow GR.I.F.O. (4) providing accuracy and absence of unwanted chattering.

## Installation layout

The picture below shows the recommended installation lay-out of the CSA XLC 320/420-R, used as a pressure relief in derivation from the main line to protect a pumping station. The sectioning devices are very important for maintenance operations; whenever possible a filter too is needed to prevent dirt from reaching the control valve. The set point should always remain within 0,5-1 bar above the maximum steady state pressure value of the pumps.

## Upstream pressure relief surge anticipating control valve **Mod. XLC 321/421**

The CSA Model XLC 321/421, installed in derivation from the main line, will act as a protection of the system against the devastating effects of water hammer caused by pump failure. Thanks to a circuit composed of two pilots, hydraulic accelerators and CSA exclusive flow control stabilizer, the valve will serve both as a pressure relief, in case of rise of pressure, and as an anticipator of water hammer in case of pump failure providing the valve with a response time almost instantaneous. For the proper sizing and water hammer analysis please contact CSA.

### Applications

- At the pumping stations, downstream of pumps check valves in derivation from the main line.
- The valve is usually associated to CSA anti-surge combination air valves FOX 3F AS and other CSA products chosen by the water hammer analysis.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.
- CSFL mechanical flow regulator.

### Note to the engineer

- For the recommended flow rate, and operating conditions, please use the charts available on the XLC series engineering.
- CSA needs the project data for a surge analysis which is highly recommended for the sizing and setting of XLC 321/421.
- The AC (anti-cavitation) system is always recommended for this kind of valve.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 1,5 bar.
- Maximum operating pressure: 25 bar.
- Maximum temperature: 70°C.

### Upstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.
- Higher values up to 25 bar on request.

### Pressure relief pilot adjustment range

- Red spring: 1,5 to 15 bar.
- Higher values up to 25 bar on request.

## Operating principle

The circuit is sensing the pressure of the main line through a dedicated pressure port (14). Two pilots, one for high pressure (5) and the second for low pressure (6), are both pre-set according to the results of the water hammer analysis. Should the upstream pressure rise above the high pressure pilot (5) the latter will open putting the main chamber (10) in communication with the downstream boundary condition (usually atmosphere, tank or other lower pressure values) thus pushing the obturator upwards in order to open the main valve (9) and discharge the exceeding pressure. Should the pump trip due to power failure the lower pressure pilot (6) will first sense the decrease in pressure, to allow flow through the accelerator (7) and relieve pressure of the control chamber (10), thus causing the opening of the main valve (9) with a response time almost immediate. Needle valves (15 and 16) are used for the proper regulation and set up. The flow in and out of the main chamber is controlled by the flow stabilizer GR.I.F.O. (4) providing accuracy and absence of chattering.

## Installation layout

The installation lay-out of the CSA XLC 321/421, used as a protection device in derivation from the main line includes sectioning devices, very important for maintenance operations. Whenever possible a filter too is needed to prevent dirt from reaching the control valve. Anti-surge combination air valves CSA Mod. FOX 3F AS are advised near the XLC 321/421 to avoid negative pressure conditions (if likely to occur), and also used as a static pressure sensing port for the circuit through their drainage valve.

## Upstream pressure sustaining level control valve Mod. XLC 324/424

The CSA Model XLC 324/424 is a globe pattern hydraulically operated automatic control valve that sustains the upstream pressure to a pre-set value regardless of variations in demand and, at the same time, it controls and regulates the minimum and maximum level inside a tank. Should the upstream pressure drop below the set point, during opening, the valve will throttle ensuring the water supply to higher zone consumers. The CSA XLC 324/424 is extremely important to stabilize HGL, contain unwanted surges and to limit the excessive flow to the tank.

### Applications

- To prioritize high zone consumers during tank filling thanks to the upstream pressure sustaining function.
- On the inlet supply line of storage tanks to limit the flow required for the level control, in accordance with water demand patterns.
- On high rise buildings to ensure the proper regulation and control of rooftops reservoirs, avoiding possible overflow and damages, maintaining the required upstream pressure.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Avoid possible high points and steep changes in slopes of the piping between the valve and the level control pilot.
- The AC (anti-cavitation) system is needed for application with static values above 7 bar, in this case consult with CSA for the proper valve sizing.

### Additional features

- XLC 324/424-FR upstream pressure relief/sustaining valve with back-flow prevention.
- XLC 324/424-5 upstream pressure relief/sustaining automatic valve with solenoid control for electric float back-up.
- XLC 324/424-R upstream pressure relief/sustaining valve with surge prevention pilot.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 16 bar.
- Recommended working pressure: 6 bar. Higher on request.
- Maximum temperature: 70°C.

### Upstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.

### Level control pilot adjustment range

- Between 0,2 and 4 meters.

## Operating principle

The XLC 324/424 is an automatic control valve operated by a two ways pilot for upstream pressure sustain (5) linked to a pilot for minimum and maximum level control (13), that can be installed inside the main tank or on an external stilling container (as per the picture). The valve is always closed when the level of the tank has reached the maximum, as all pressure will be diverted from upstream (1) to the cover of the pressure sustaining pilot (5) going through the three ways level control unit Rotoway (13). When water reaches the minimum level inside the tank the pressure of the pilot's cover (5) is relieved through the drain (17) of the three ways pilot (13), the main valve (9) will then sustain the line pressure to the minimum pre-set and adjustable value of the pilot (5). The flow in and out of the main chamber is controlled by the CSA exclusive unit flow GR.I.F.O. (4) providing accuracy and absence of unwanted chattering.

## Installation layout

In the installation lay-out of the CSA XLC 324/424, performing the level control through an external stilling tank (2), a maximum vertical distance of 4 meters is recommended between the valve and the maximum water level. The sectioning devices (1) are very important for maintenance operations; whenever possible a filter (3) too is needed to prevent dirt from reaching the control valve. Anti-surge air valves FOX 3F AS are advised upstream of the valve for air release during working conditions and commissioning.

## Upstream pressure sustaining valve with solenoid control Mod. XLC 325/425

The CSA Model XLC 325/425 is a globe pattern hydraulically operated automatic control valve that sustains the upstream pressure to a pre-set value regardless of variations in demand. Thanks to the solenoid control the valve will be able to close or open, in response to a signal sent from remote or by an external controller. Should the upstream pressure drop below the pilot set point the valve will close drip tight, assuring the proper operation also in static conditions.

### Applications

- On the inlet supply line of storage tanks, to control the flow and the level through an electric float.
- On gravity fed supply lines to prioritize the consumers at the higher elevation zones, with the safety of opening/closing according to signals/alarms.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet pressure, outlet pressure, flow rate and application are required for the proper sizing and cavitation analysis.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- A minimum length of 3 DN upstream of the valve is recommended for the best accuracy.

### Additional features

- XLC 325/425-FR upstream pressure sustaining with solenoid control and back-flow prevention.
- XLC 325/425-R upstream pressure relief valve with fast acting pilot and solenoid control.
- XLC 325/425-H upstream pressure sustaining valve with high sensitivity pilot and solenoid control.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Max. operating press.: 16 bar. Higher on request.
- Maximum temperature: 70°C.

### Upstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.
- Higher values up to 25 bar on request.
- Values lower than 0,7 available on request.

### Solenoid electrical data

- Voltages: 24 V DC, 24 V/50 Hz, 230 V/50 Hz. Other voltages on request.
- Power consumption: inrush AC (VA) 24, hold AC (VA) 17 (8 W), DC hot/cold coil 8/9 W.

The flow in and out of the main chamber is controlled by the flow stabilizer GR.I.F.O. (4) providing accuracy and absence of chattering.

In the following picture the CSA XLC 325/425 is linked to a CSA controller (7) or any other electronic device sending impulses to the solenoid on the circuit. Sectioning devices (1, 2) and by-pass are needed for maintenance operations, and a filter (3) to prevent dirt. The pressure sustaining valve VSM (4) is the best choice on the by-pass thanks to its reliability also after long periods of inactivity. Anti-surge air valves FOX 3F AS (5, 6) are recommended upstream and downstream of the installation.

## Upstream pressure sustaining constant level control valve Mod. XLC 326/426

The CSA Model XLC 326/426 is a globe pattern hydraulically operated automatic control valve that sustains the upstream pressure to a minimum value and at the same time regulates the constant level of a tank, regardless of upstream pressure variations. Thanks to a needle valve on the chamber the response time can be adjusted, to prevent water hammer effects during the closing phase. Normally equipped with visual position indicator and entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- For break pressure tanks and when a proportional level control is needed within the pilot's range.
- For level control on gravity fed pipelines.
- For small tank and in need of maintaining a constant level with a continuous modulating without excessive drop in pressure.

### Accessories

- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- CSFL mechanical flow regulator.

### Note to the engineer

- Avoid bends and high points on the piping to connect the main valve to the level control pilot to prevent the formation of air pockets.
- For the proper functioning a minimum of 1 bar on the level control pilot is needed, failing in doing so would create delays and malfunctioning.

### Additional features

- XLC 326/426-FR pressure sustaining and constant level valve with back-flow prevention.
- XLC 326/426-R pressure sustaining and constant level valve with surge prevention pilot.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 1 bar on the level control pilot.
- Maximum operating pressure: 16 bar.
- Recommended working pressure: 6 bar. Higher on request.
- Maximum temperature: 70°C.

### Upstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.
- Higher values up to 25 bar on request.

### Constant level pilot adjustment range

- 85 mm as a standard, different on request.

[illegible]

## Installation layout

A 3D rendering of a fire alarm system installation. It features a blue pipe that runs vertically and then horizontally. A blue valve assembly with a handwheel is connected to the horizontal section of the pipe. A blue ladder is mounted on the wall next to the vertical section of the pipe. The entire system is shown in a clean, white environment.

## Differential pressure sustaining valve Mod. XLC 395/495

The CSA Model XLC 395/495 is a globe pattern hydraulically operated automatic control valve that sustains a minimum upstream pressure differential value between two points, pre-set and adjustable, regardless of variations in demand. Entirely made in ductile cast iron with FBT epoxy (fluid bed technology) coating with internals in stainless steel, the valve has been designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- On the main supply line of pumping stations to prevent overload and to avoid cavitation.
- On cooling systems for pressure balancing between circuits.
- On filtration systems for emergency by-pass.

### Additional features

- XLC 395/495-FR differential upstream pressure sustaining valve with back-flow prevention.
- XLC 395/495-5 differential upstream pressure sustaining valve with solenoid control.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 25 bar.
- Maximum temperature: 70°C.

### Note to the engineer

- Inlet pressure, outlet pressure, flow rate and application are required for the proper sizing and cavitation analysis.
- For flow rate and operating conditions use the charts on XLC series engineering.
- A minimum length of 3 DN upstream of both pressure ports is recommended for the proper operation and the best accuracy.

### Upstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.
- Higher values up to 25 bar on request.
- Values lower than 0,7 available on request.

## Operating principle

The CSA Model XLC 395/495 is operated by a two ways pilot (5), with pre-set and adjustable set point value, sensing two pressures points in order to maintain a required differential between them.

The first point is actually the downstream pressure (7) acting on the pilot's cover, while the second (13) is the upstream pressure, sensed either upstream or through an external port away from the valve, and connected to the pilot's intermediate body (14). Both values are required for the valve to work, creating the differential pressure needed for the design, whose circuit is controlled by the exclusive CSA unit flow control device GR.I.F.O (4) for the best accuracy and proper response time. Should the difference in pressure rise above the pilot's set point the latter will open thus discharging the main chamber (10) and moving the obturator (11) towards the open position. Should the difference in pressure be lower than the pilot's set point the latter will throttle, diverting all pressure towards the main chamber (10) thus pushing the obturator (11) onto the seat (12) and reducing the flow rate through the main supply line.

## Installation layout

The picture shows the installation lay-out of the CSA XLC 395/495 used for pump control, to avoid overload and cavitation, where pressure is taken before and after the pump (1) in order to maintain the required difference in pressure. In case of by-pass, needed for maintenance, the pressure sustaining valve VSM (2) is the best choice thanks to its reliability also after long periods of inactivity. Anti-surge combination air valves FOX 3F AS (3, 4) are recommended upstream and downstream of the installation.

## Flow rate automatic control valve Mod. XLC 330/430

The CSA model XLC 330/430 is a globe pattern hydraulically operated automatic control valve that limits the flow to a pre-set value, regardless of pressure variations. In case of flow rate lower than the required set point the valve will be fully opened. The valve is supplied with an orifice plate assembly, needed for the proper functioning and connected to the pilot. Normally equipped with visual position indicator and entirely made in ductile cast iron with FBT (fluid bed technology) epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- Downstream of pumps to prevent overload and for cavitation protection.
- On the inlet supply lines of tanks to prevent excessive flow.
- In distribution networks and on the supply lines of residential and industrial districts to limit the flow during peak hours.
- In filtration systems to prevent excessive flow avoiding damages and malfunctioning.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet and outlet pressure, flow rate are required for the proper sizing.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- For the best accuracy leave 5 DN between the valve and the orifice plate and 3 DN downstream of it (picture in the next page).

### Additional features

- XLC 330/430-FR flow rate control valve with back-flow prevention.
- XLC 330/430-H flow rate control valve with high sensitivity pilot.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 1,2 bar.
- Maximum operating pressure: 16 bar. Higher on request.
- Maximum temperature: 70°C.

### Flow rate control pilot adjustment range

- The orifice plate assembly is calculated and machined according to the maximum flow rate. An adjustment range of the value is possible according to the regulation flow chart supplied with the valve.

## Operating principle

The CSA model XLC 330/430 is operated by a two 2 ways pilot (5), for flow control, with pre-set set and adjustable values, sensing the drop in pressure produced by the orifice plate (13), where a stainless steel disk is inserted inside a flange and connected to the pilot with a sensing line (14) non supplied.

Should the flow exceed the maximum value the differential pressure will increase and pilot (5) will throttle and limit the flow to direct inlet pressure to the main chamber (10), to generate the head loss required through the seat (12) for the valve (9) to control the flow. Should the flow remain below the pilot's set point, the differential pressure across the orifice plate (13) will be less than the pilot's (5) spring force, therefore the valve will remain fully open.

Pressure in and out of the main chamber (10) is controlled by the CSA exclusive regulation device with filter called GR.I.F.O. (4), needed for the valve's response time and accuracy.

## Installation layout

The picture shows the recommended lay-out of the CSA XLC 330/430. The flange orifice (8), calculated and machined according to the project's requirements, is connected to the valve's pilot (9). Sectioning devices (1, 2) and by-pass are very important for maintenance operations, as well as the filter (3) to prevent dirt from reaching the control valve. Anti-surge combination air valves FOX 3F AS (6, 7) are recommended, as well as a pressure relief valve, like CSA VSM (5) to prevent rise in pressure on the main line.

## Flow control and pressure reducing automatic valve Mod. XLC 331/431

The CSA model XLC 331/431 is a globe pattern hydraulically operated automatic control valve that reduces and stabilizes the downstream pressure to a constant set-point, regardless of variation in demands, limiting at the same time the flow rate to a maximum value. Normally equipped with visual position indicator and made in ductile cast iron with FBT (fluid bed technology) epoxy coating and stainless steel, the valve reduces head loss, throttling noise and cavitation damage. The valve is supplied with an orifice plate assembly, needed for the proper functioning and connected to the pilot.

### Applications

- Downstream of pumps to reduce the pressure and prevent overload.
- As a protection against rise in pressure of industrial equipment, plants and civil installations, limiting the flow to prioritize high zones consumers.
- In filtration systems to prevent excessive flow and unwanted rise in pressure avoiding damages and malfunctioning.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet and outlet pressure, flow rate are required for the proper sizing.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- For the best accuracy leave 5 DN between the valve and the orifice plate and 3 DN downstream of it (picture in the next page).

### Additional features

- XLC 331/431-FR pressure reduction and flow control valve with back-flow prevention.
- XLC 331/431-H pressure reduction and flow control valve with high sensitivity pilot.
- XLC 331/431-5 pressure reduction and flow control valve with solenoid control.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 1,5 bar.
- Maximum operating pressure: 16 bar. Higher on request.
- Maximum temperature: 70°C.

### Downstream pressure pilot adjustment range

- Red spring: 1,5 to 15 bar.

### Flow rate control pilot adjustment range

- The orifice plate assembly is calculated and machined according to the maximum flow rate. An adjustment range of the value is possible according to the regulation flow chart supplied with the valve.

## Operating principle

The CSA model XLC 331/431 is operated by two 2 ways pilots (14-5), namely for pressure reduction and flow control, with pre-set and adjustable values. The downstream pressure is sensed after the orifice plate assembly (15). Should the downstream pressure rise above the pilot (14) set-point the latter will throttle and limit the flow to direct inlet pressure to the main chamber (10), to reduce and stabilize the downstream pressure to a constant value. Should the downstream pressure fall below the pilot set-point the obturator (11) will raise, to reduce the head loss followed by the rise in pressure. The flow rate control pilot (5) receives the downstream pressure on the cover where the spring is adjusted to compensate the difference in pressure produced by the orifice plate assembly. Should the flow exceed the maximum value the pilot (5) will throttle and limit the flow to direct inlet pressure to the main chamber (10), to generate the head loss required for flow control. The CSA regulation device with filter called GR.I.F.O. (4) guarantees the valve's response time and accuracy.

## Installation layout

The installation lay-out of the CSA XLC 331/431 includes sectioning devices (1, 2) and by-pass, with CSA direct acting pressure control valves (4), very important for maintenance operations. The orifice plate assembly (8) needs to be located 5 DN downstream of the valve leaving 3 DN more before any change in direction, slope and cause of turbulence in the fluid. FOX 3F AS (6, 7) are recommended for air release and commissioning as well as pressure relief valve CSA VSM (5) to prevent rise in pressure on the line.

## Flow regulation valve with minimum-maximum level control **Mod. XLC 334/434**

The CSA Model XLC 334/434 is a globe pattern hydraulically operated automatic control valve that controls the minimum and maximum level of a tank limiting, at the same time, the maximum flow to a requested value regardless of pressure variations.

Normal equipped with visual position indicator and made in ductile cast iron with FBT (fluid bed technology) epoxy coating and stainless steel, the valve reduces head loss, throttling noise and cavitation damage. An orifice plate assembly, needed for the proper functioning, is supplied with the valve.

### Applications

- On the outlet supply of storage tanks or downstream booster pump stations to control the maximum flow and limit the level within the required values.
- On the rooftop reservoirs as hydraulic back up for level control to avoid overflow.
- On the inlet supply line of storage tanks to control the level and avoid excess in flow during opening.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- For the best accuracy leave 5 DN between the valve and the orifice plate and 3 DN downstream of it.

### Additional features

- XLC 334/434-FR minimum and maximum flow level control valve with back flow prevention system.
- XLC 334/434-5 minimum and maximum level control valve with solenoid.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 1,2 bar.
- Maximum operating pressure: 16 bar.
- Recommended working pressure: 6 bar. Higher on request.
- Maximum temperature: 70°C.

### Flow rate control pilot adjustment range

- The orifice plate assembly is calculated and machined according to the maximum flow rate. An adjustment range of the value is possible according to the regulation flow chart supplied with the valve.

### Min.-max. level control pilot adjustment range

- Between 0,2 and 4 meters.

## Operating principle

The CSA model XLC 334/434 is operated by a 2 ways pilot (5) for flow control and connected to the orifice plate assembly (13), with pre-set and adjustable values, sensing the differential pressure created by the flow rate. The three ways minimum and maximum level pilot Rotoway (16) receives the upstream pressure from the G.R.I.F.O. (4) and, by means of the hydraulic flow accelerator (15), will interrupt the flow to the circuit diverting all pressure to the main chamber (10) when the water level has reached the maximum value. Should the latter drop below the minimum set-point, both values adjustable through mechanical blocks sliding on the wire, pressure is relieved out of the chamber of the flow accelerator (15) through the three ways pilot drain (20). Consequently the pressure of the control chamber (10) will be diverted downstream pushing the obturator upwards to generate flow through the main valve (9), enabling the flow rate control function of the pilot (5), whose spring is set to balance for the differential pressure created by the orifice assembly (13).

## Installation layout

In the installation lay-out the CSA XLC 334/434, flow regulation valve with minimum and maximum level control, is used on an external stilling tank (2). The flange orifice (5), calculated and machined according to the project's requirements, is connected to the valve's pilot (6). The sectioning devices (1) and by-pass, where CSA direct acting pressure sustaining valves Model VSM (4) are advised, are very important for maintenance operations, as well as the filter (3) to prevent dirt from reaching the control valve.

## Flow automatic control valve with solenoid control Mod. XLC 335/435

The CSA Model XLC 335/435 is a globe pattern hydraulically operated automatic control valve that, working in combination with an orifice plate assembly, limits the maximum flow to a maximum pre-set value, adjustable and regardless of pressure variations. In case of flow rate lower than the required set point the valve will be fully opened. The circuit is also equipped with a solenoid and flow accelerator to enable on-off control in response to signals. Entirely made in ductile cast iron with FBT (fluid bed technology) epoxy coating and stainless steel, the valve reduces head loss, throttling noise and cavitation damages.

### Applications

- Downstream of pumps to prevent overload and for cavitation protection with on-off control in case of alarms and emergencies.
- On the inlet supply lines of tanks to prevent excessive flow with the possibility of electric float back up.
- In main transmission lines and water distribution systems to equalize operating supply hours between valves and limit the flow for various regimes.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet and outlet pressure, flow rate are required for the proper sizing.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- For the best accuracy leave 5 DN between the valve and the orifice plate and 3 DN downstream of it (picture in the next page).

### Additional features

- XLC 335/435-FR flow regulation with solenoid control valve with back flow prevention system.
- XLC 335/435-H flow regulation with solenoid control valve with high sensitivity pilot.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 1,2 bar.
- Max. operating press.: 16 bar. Higher on request.
- Maximum temperature: 70°C.

### Flow rate control pilot adjustment range

- The orifice plate assembly is calculated and machined according to the maximum flow rate. An adjustment range of the value is possible according to the regulation flow chart supplied with the valve.

### Solenoid electrical data

- Voltages: 24 V DC, 24 V/50 Hz, 230 V/50 Hz. Other voltages on request.
- Power consumption: inrush AC (VA) 24, hold AC (VA) 17 (8 W), DC hot/cold coil 8/9 W.

## Operating principle

The XLC 335/435 is operated by a 2 ways pilot (5), for flow control with pre-set and adjustable values, sensing the drop in pressure produced by the orifice plate (13). Should the flow exceed the maximum value the differential pressure will increase and pilot (5) will throttle and limit the flow, to direct inlet pressure to the main chamber (10) and generate the head loss required through the seat (12) for the valve (9) to control the flow rate. Should the flow remain below the pilot's set-point, the differential pressure across the orifice plate (13) will be less than the pilot's (5) spring force, therefore the valve will remain fully open. A solenoid valve (16) working in combination with an hydraulic accelerator (15) is either interrupting the flow through the circuit pushing the valve (9) to the closed position, or discharging the main chamber (10) to by-pass the flow control pilot (5) and open the main valve (9) completely. Pressure in and out of the main chamber (10) is controlled by the CSA exclusive regulation device with filter called GR.I.F.O. (4), needed for the valve's response time and accuracy.

## Installation layout

In the picture the CSA XLC 335/435 is linked to CSA controller (10) or any other electronic device sending impulses according to the function required. The flange orifice (8) is connected to the valve's pilot (9). Sectioning devices (1, 2) and a by-pass with CSA pressure control valves (4) are needed for maintenance operations. Anti-surge air valves CSA FOX 3F AS (6, 7) are recommended for air release and commissioning, as well as a pressure relief valve CSA VSM (5) to prevent rise in pressure.

## Burst automatic control valve Mod. XLC 380/480

The CSA Model XLC 380/480 is a globe pattern hydraulically operated automatic control valve that senses the increase in flow above a pre-set and adjustable value of a high sensitivity pilot, diverting the upstream pressure to the main control chamber and causing a complete closure, to be manually reset after that. As long as the flow rate remains below the set point, the valve will be fully open minimizing head loss. Normally equipped with visual position indicator and entirely made in ductile cast iron with FBT (fluid bed technology) coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damages.

### Applications

- On gravity fed supply lines to avoid depressurization in case of pipe burst due, for example, to landslides.
- On the outlet supply line of storage tanks, water towers to close in case of pipe bursts downstream, preventing level from dropping below a minimum value.
- On water distribution systems and critical supply lines to interrupt flow in case of severe failures like earthquakes, external damages.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet pressure, outlet pressure, flow rate and application are required for the proper sizing and cavitation analysis.
- A minimum length of 3 DN downstream and upstream of the valve is recommended for the best accuracy (picture in the next page).

### Additional features

- XLC 380/480-FR burst automatic control valve with back-flow prevention.
- XLC 380/480-5 burst automatic control valve with solenoid control.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 1,5 bar.
- Maximum operating pressure: 16 bar.
- Recommended working pressure: 6 bar. Higher on request.
- Maximum temperature: 70°C.

### Flow rate control pilot adjustment range

- The valve is supplied with the pilot set to the required threshold flow rate, whose adjustment range is available according to the regulation flow chart supplied with the valve.

## Operating principle

The CSA model XLC 380/480 is operated by a 2 ways high sensitivity pilot (5), for flow control, with pre-set set and adjustable values, sensing the drop in pressure through the valve produced by the flow rate. Should the latter exceed the maximum value the differential pressure will increase and pilot (5) will open, putting the upstream pressure in communication with the main chamber (10) and closing the main valve (9). Should the flow remain below the pilot's set-point the valve will remain fully open. Once it has been closed the valve needs to be open manually through the isolation ball valve (13) discharging the main chamber (10).

Pressure in and out of the main chamber (10) is controlled by the CSA needle valve (3) for a smooth regulation, while a filter (4) will prevent debris and dirt from entering the hydraulic circuit with the risk of clogging and possible malfunctioning.

## Installation layout

The CSA valve XLC 380/480 may cause pressure surge upon closure depending on the location, fluid velocity, differential pressure. A pressure relief valve installed upstream, CSA VSM or fast acting CSA VRCA (5), is therefore recommended, along with a pressure sustaining valve XLC 420 (4) or VSM on the by-pass line for the maintenance operations. Anti-surge combination air valves FOX 3F AS (6, 7) are also needed for air control and water hammer protection during commissioning and pipe filling.

## Minimum-maximum level automatic control valve Mod. XLC 340/440

The CSA Model XLC 340/440 is a globe pattern hydraulically operated automatic control valve that regulates the minimum-maximum level of a tank, with an adjustable range, regardless of upstream pressure variations. Thanks to a CSA needle valve the response time can be regulated, to prevent water hammer effects during the closing phase. Normally equipped with visual position indicator and entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- On storage tank to perform a minimum and maximum control, decreasing the operating cycles and therefore maintenance, using at the same time most of the storage capacity.
- For level control with an external container should the main tank not be accessible.
- On rooftop and elevated reservoir in general where level control is maintained through pumps operations, and an hydraulic backup is needed to avoid overflow.

### Accessories

- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- CSFL mechanical flow regulator.

### Note to the engineer

- Avoid bends and high points on the piping to connect the main valve to the level control pilot to prevent the formation of air pockets.
- A minimum of 0,6 bar on the pilot is needed, failing in doing so would create delays and malfunctioning. Consider the use of a sustaining pilot for low pressure conditions and/or the CSFL mechanical flow regulator.

### Additional features

- XLC 340/440-FR minimum maximum level control with back-flow prevention.
- XLC 445 minimum maximum level control with solenoid control.
- XLC 340/440-R minimum maximum level control with surge prevention pilot.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,6 bar on the pilot.
- Maximum operating pressure: 16 bar.
- Recommended working pressure: 6 bar. Higher on request.
- Maximum temperature: 70°C.

### Min.-max. level control pilot adjustment range

- Between 0,2 and 4 meters.

## Operating principle (for DN 150-600)

The CSA valve model XLC 340/440 is operated by a 3 ways pilot connected to the valve by means of two pipes, not supplied. The level control pilot, entirely made in stainless steel, is composed of a body (3), lever (7), float (15) and wire, and contains two mechanical blocks adjustable and set to the required level (14 and 16). Should the latter reach the maximum level the float (15) moves the upper block (14) upwards, to rotate the lever (7) thus allowing the closing of the valve by putting the upstream pressure in communication with the chamber of the valve (10) or the hydraulic accelerator (13) (available from DN 150 and above). The valve remains closed until the level drops to the lower set point (16) which enables the rotation of the lever (7) putting the chamber (10 or 13) in communication with the atmosphere, thus raising the obturator (11) to generate flow through the seat (12). A needle valve on the chamber (2) will control pressure and flow in and out to prevent surges during closure.

## Installation layout

The picture shows the layout of the XLC 340/440 minimum-maximum level control valve. The connection between the valve and the pilot (4) is obtained by means of two pipes, one linked to the upstream pressure and the other to the chamber. Sectioning devices (1) and filter (3) are needed for maintenance operations and to prevent dirt from entering the main valve. The external stilling container (2), strongly advised, allows for the proper control reducing turbulence of the water surface without having to access the tank.

## Constant level automatic control valve Mod. XLC 360/460-MCP

The CSA Model XLC 360/460-MCP is a globe pattern hydraulically operated automatic control valve that regulates the constant level of a tank, regardless of upstream pressure variations, by means of a stainless steel proportional flow modulating pilot. Thanks to a needle valve on the chamber the response time can be adjusted, to prevent water hammer effects during the closing phase. Normally equipped with visual position indicator and entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- For break pressure tanks and when a proportional level control is needed within the pilot's range.
- For level control on gravity fed pipelines.
- For small tank and in need of maintaining a constant level with a continuous modulating.

### Accessories

- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- CSFL mechanical flow regulator.

### Note to the engineer

- Avoid bends and high points on the piping to connect the main valve to the level control pilot to prevent the formation of air pockets.
- For the proper functioning a minimum of 0,6 bar on the pilot is needed, failing in doing so would create delays and malfunctioning. Consider the use of a sustaining pilot for low pressure conditions and/or the CSA CSFL mechanical flow regulator.

### Additional features

- XLC 360/460-MCP-FR constant level control valve with back-flow prevention.
- XLC 360/460-MCP-R constant level control valve with surge prevention pilot.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,6 bar on the pilot.
- Maximum operating pressure: 16 bar.
- Recommended working pressure: 6 bar. Higher on request.
- Maximum temperature: 70°C.

### Constant level pilot adjustment range

- 85 mm as a standard, different on request.

## Operating principle

The CSA model XLC 360/460-MCP is operated by a 2 ways flow modulating proportional pilot (3) entirely made in stainless steel and connected to the valve by means of a pipe, not supplied. Should the level inside the tank drop due to consumption the pilot (3) will open through the drain (5) discharging the main chamber (10), and generating a passage through the seat (12) in proportion to the demand, lifting the obturator (11) upwards accordingly. Should the tank level rise due to the refilling the pilot (3) will modulate, throttling the flow through the drain (5) and, if required, closing the valve by putting the upstream pressure in communication with the main chamber (10). A fixed orifice is present on the filter (7) for the proper functioning, while a needle valve on the chamber (2) will control pressure and flow in and out to prevent surges during closure.

## Installation layout

The XLC 360/460-MCP is linked to the pilot (2) through a single pipe. Sectioning devices (1) are recommended for maintenance and a filter (3) is needed upstream, to prevent dirt from entering the main valve, affecting the performance. The constant level control pilot (2) should always be located in a position away from the water surface turbulence created by the inlet supply pipe to the tank. In case of static values higher than 6 bar the AC (anti-cavitation) system and a CSA pressure reducer VRCD are advised.

## Constant level automatic control valve XLC 360/460 - Rotoway

The CSA Model XLC 360/460-Rotoway is a globe pattern hydraulically operated automatic control valve that regulates the constant level of a tank, by means of a three ways pilot in stainless steel, regardless of upstream pressure variations. Thanks to a CSA needle valve the response time can be adjusted, to prevent water hammer effects during the closing phase. Normally equipped with visual position indicator, and entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- For break pressure tanks, when a constant level control is needed and a stainless steel pilot is required.
- For level control on gravity fed pipelines.
- For small tank in need of maintaining a constant level with on/off regulation.

### Accessories

- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.
- AC anti-cavitation trim to provide a higher resistance to cavitation and accurate regulation in case of low flow.
- CSFL mechanical flow regulator.

### Note to the engineer

- Avoid bends and high points on the piping to connect the main valve with the level control pilot to prevent the formation of air pockets.
- For the proper functioning a minimum of 0,6 bar on the pilot is needed, failing in doing so would create delays and malfunctioning. Consider the use of a sustaining pilot for low pressure conditions and/or the CSA CSFL mechanical flow regulator.

### Additional features

- XLC 360/460-Rotoway-FR constant level control valve with back-flow prevention.
- XLC 360/460-Rotoway-R constant level control valve with surge prevention pilot.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,6 bar on the pilot.
- Maximum operating pressure: 16 bar.
- Recommended working pressure: 6 bar. Higher on request.
- Maximum temperature: 70°C.

### Constant level pilot adjustment range

- 360 mm as standard, different on request by changing the lever.

## Operating principle (for DN 150-600)

CSA model XLC 360/460-Rotaway is operated by a 3 ways pilot connected to the valve by means of two pipes, not supplied. The pilot assembly, entirely made in stainless steel, is composed of a body (3), float (4) sensing the water level variation and a lever (14) which can be adapted according to the project requirements. Should the water level reach the maximum threshold the float (4) moves upwards, rotating the lever (14) thus allowing the closing of the valve by putting the upstream pressure in communication with the chamber (10) of the valve or the hydraulic accelerator (13) (available from DN 150 and above). The valve remains closed until the level drops to the lowest set point (16), which enables the rotation of the lever (14) putting the chamber (10) in communication with the atmosphere, thus raising the obturator (11) to generate flow through the seat (12). The exclusive CSA needle valve on the chamber (2) will control pressure and flow in and out to prevent surges during closure.

## Installation layout

In the installation layout the XLC 360/460 Rotaway is linked to the pilot (2) through two pipes. The filter (3) is needed upstream to prevent dirt and sectioning devices (1) are mandatory to perform maintenance operations. The constant level control pilot (2) should always be located in a position away from the water surface turbulence created by the inlet supply pipe to the tank. In case of static values higher than 6 bar the AC (anti-cavitation) system and a CSA pressure reducer VRCD are advised.

## Constant level control valve with on-off solenoid control Mod. XLC 365/465-MCP

The CSA Model XLC 365/465-MCP maintains the constant level of a tank, regardless of upstream pressure variations, by means of a flow modulating proportional pilot in stainless steel.

The circuit is also equipped with a solenoid to enable an on-off control mode in response to signals from remote or by a controller. Thanks to a CSA needle valve the response time can be adjusted, to prevent water hammer effects during the closing phase. Normally equipped with visual position indicator, and entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- For break pressure tanks with a proportional level control and emergency electronic backup, to prevent overflow.
- For level control on gravity fed pipelines with on/off mode operated from remote or alarms.

### Accessories

- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.
- AC anti-cavitation trim to provide a higher resistance to cavitation and accurate regulation in case of low flow.
- CSFL mechanical flow regulator.

### Note to the engineer

- Avoid bends and high points on the piping to connect the main valve with the level control pilot to prevent the formation of air pockets.
- For the proper functioning a minimum of 0,6 bar on the pilot is needed, failing in doing so would create delays and malfunctioning. Consider the use of a sustaining pilot for low pressure conditions and/or the CSA CSFL mechanical flow regulator.

### Additional features

- XLC 365/465-MCP-FR constant level valve with solenoid control and back-flow prevention.
- XLC 365/465-MCP-R constant level valve with solenoid control and surge prevention pilot.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,6 bar on the pilot.
- Maximum operating pressure: 16 bar.
- Recommended working pressure: 6 bar. Higher on request.
- Maximum temperature: 70°C.

### Constant level pilot adjustment range

- 85 mm as a standard, different on request.

### Solenoid electrical data

- Voltages: 24 V DC, 24 V/50 Hz, 230 V/50 Hz. Other voltages on request.
- Power consumption: inrush AC (VA) 24, hold AC (VA) 17 (8 W), DC hot/cold coil 8/9 W.

## Operating principle

The XLC 365/465-MCP is operated by a 2 ways flow modulating proportional pilot (3) in stainless steel connected to the valve by means of a pipe, not supplied. Should the level inside the tank drop due to consumption the pilot (3) will open the drain (5) discharging the main chamber (10) to generate a passage through the seat (12), in proportion to the demand, lifting the obturator (11) upwards. Should the tank level rise due to the refilling the pilot (3) will modulate, throttling the flow through the drain (5) and, if required, closing the valve by putting the upstream pressure in communication with the chamber (10). In case of signals sent to the solenoid valve (13) the flow through the hydraulic accelerator (6) will be interrupted, therefore diverting the upstream pressure to the main chamber (10) and closing the main valve (9).

A fixed orifice is present on the filter (7) for the proper functioning, while a needle valve (2) on the chamber (10) will control pressure and flow in and out to prevent surges during closure.

## Installation layout

The XLC 365/465-MCP is linked to the pilot (2) through a single pipe and operated by signals sent by a CSA controller or from remote. Sectioning devices (1) are recommended for maintenance and a filter (3) is needed upstream, to prevent dirt from entering the main valve. The level pilot (2) should always be located in a position away from the turbulence created by the inlet supply pipe to the tank. In case of static values higher than 6 bar the AC (anti-cavitation) system and a CSA pressure reducer VRCD are advised.

## High sensitivity altitude automatic control valve Mod. XLC 370/470

The CSA Model XLC 370/470 is a globe pattern hydraulically operated automatic valve that maintains the constant level of a reservoir and water tower, regardless of upstream pressure variations. The modulating control ensures a smooth regulation and absence of water hammer, as the valve will react proportionally to the variations in demand. Normally equipped with visual position indicator, and entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- To perform the level control of elevated tanks and water towers.
- Through the high sensitivity pilot to control the water level, without accessing the tank and the need of any piping and pilots.
- On the tank and reservoirs outlet supply lines to control the consumption by means of the storage static pressure.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet pressure, outlet pressure, flow rate and application are required for the proper sizing and cavitation analysis.
- For the proper functioning a minimum of 0,25 bar static value acting on the pilot is needed. Consider the use of a sustaining pilot for low pressure conditions and/or the CSA CSFL mechanical flow regulator.

### Additional features

- XLC 370/470-FR altitude automatic control valve with back-flow prevention.
- XLC 427 upstream pressure sustaining and altitude control valve.
- XLC 427-5 altitude automatic control valve with on-off solenoid control.
- The valve can be supplied without the regulation device GR.I.F.O. on request.

### Working conditions

- Fluid: treated water.
- Min. operating pressure on the valve: 0,7 bar.
- Minimum static pressure on the pilot: 0,25 bar.
- Max. operating press.: 16 bar.
- Recommended working pressure: 6 bar. Higher on request.
- Maximum temperature: 70°C.

### Altitude pilot adjustment range

- Blue spring: 0,3 to 1,8 bar.
- Red spring: 0,6 to 2,8 bar.
- Different values on request.

## Operating principle

The CSA Model XLC 370/470 is operated by a 2 ways high sensitivity pilot (5) sensing the static pressure of the level in need of regulation through the port (13). Should the latter drop due to consumption, the pilot (5) will open proportionally, relieving pressure out of the main chamber (10) thus lifting the obturator upwards (11) to generate flow through the seat and refill the storage. When the water level rises the pilot (5) will modulate throttling the flow through the circuit and diverting pressure back to the chamber (10), pushing the obturator downwards, and eventually closing the valve once the level has reached maximum set-point. Pressure in and out of the main chamber (10) is controlled by the CSA exclusive regulation device with filter called GR.I.F.O. (4), needed for the valve's response time and accuracy.

## Installation layout

Level control is obtained without any external piping and simply through a pilot sensing the static pressure coming from the water tower. The lay-out includes sectioning devices (1, 2) and by-pass, where CSA automatic control valves (4) are advised, for maintenance operations, and a filter (3) to prevent dirt from entering the main valve. Anti-surge combination air valves FOX 3F AS (5) are recommended upstream to release air pockets accumulated in working conditions, and to discharge large volumes of air during filling.

## High sensitivity altitude control valve with two set points **Mod. XLC 370/470-D**

The CSA Model XLC 370/470-D is a globe pattern hydraulically operated automatic valve that regulates the water level of a reservoir and water tower within a minimum and maximum value, regardless of upstream pressure variations. The modulating control ensures a smooth regulation and absence of water hammer. Normally equipped with visual position indicator, and entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- To perform the level control of elevated tanks and water towers with a minimum and maximum range.
- Through the high sensitivity pilot to control the water level, without accessing the tank and the need of any extra piping.
- On the tank and reservoirs outlet supply lines to control the consumption by means of the storage static pressure working on a specific range pre-set and adjustable through the minimum and maximum pilots.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet pressure, outlet pressure, flow rate and application are required for the proper sizing.
- For the proper functioning a minimum of 0,3 bar static value acting on the pilot is needed. Consider the use of a sustaining pilot for low pressure conditions and/or the CSA CSFL mechanical flow regulator.

### Additional features

- XLC 370/470-FR altitude automatic control valve with back-flow prevention.
- XLC 427 upstream pressure sustaining and altitude control valve.
- XLC 427-5 altitude automatic control valve with on-off solenoid control.
- The valve can be supplied without the regulation device GR.I.F.O. on request.

### Working conditions

- Fluid: treated water.
- Min. operating pressure on the valve: 0,7 bar.
- Minimum static pressure on the pilot: 0,3 bar.
- Max. operating press.: 16 bar.
- Recommended working pressure: 6 bar. Higher on request.
- Maximum temperature: 70°C.

### Altitude pilot adjustment range

- Blue spring: 0,3 to 1,8 bar.
- Red spring: 0,6 to 2,8 bar.
- Different values on request.

## Operating principle

The CSA Model XLC 370/470-D is operated by two high sensitivity pilots (5 and 7) sensing the static pressure of the level in need of regulation through a port (13). Should the level inside the tank rise above the maximum set point the pilot (7) will open diverting the flow towards the chamber (10) closing the valve. The valve will remain closed until the water level drops, due to consumption, to the minimum value at which the pilot (5) will open, relieving pressure out of the main chamber (10) thus lifting the obturator upwards (11) to generate flow through the seat and refill the storage. Pressure in and out of the main chamber (10) is controlled by the CSA exclusive needle valve (3) to ensure smooth operation and the absence of unwanted pressure surges.

## Installation layout

Level control is obtained without any external piping and simply through a pilot sensing the static pressure coming from the water tower. The lay-out includes sectioning devices (1, 2) and by-pass, where CSA automatic control valves (4) are advised, for maintenance operations, and a filter (3) to prevent dirt from entering the main valve. Anti-surge combination air valves FOX 3F AS (5) are recommended upstream to release air pockets accumulated in working conditions, and to discharge large volumes of air during filling.

## On-off solenoid automatic control valve Mod. XLC 350/450

The CSA Model XLC 350/450 is a globe pattern hydraulically operated automatic control valve that opens and closes in response to signals applied to the solenoid on the circuit, regardless of upstream pressure variations. Thanks to a CSA needle valve located on the chamber the reaction time can be adjusted, to prevent water hammer effects during the closing phase. Normally equipped with visual position indicator and entirely made in ductile cast iron with FBT (fluid bed technology) epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- On main supply lines and water distribution networks to interrupt water supply in case of alarms and emergencies.
- In combination with an electric float for tank level regulation and control.
- As a system protection to shut-off in case of burst events.
- In filtration systems for back flushing.
- On storage tanks for automatic refreshing.

### Accessories

- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.
- CSFL mechanical flow regulator.

### Note to the engineer

- Inlet pressure, outlet pressure, flow rate and application are required for the proper sizing and cavitation analysis.
- Recommended flow rate and operating conditions on the XLC series engineering.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.

### Additional features

- XLC 350/450-FR on-off solenoid control valve with back-flow prevention system.
- XLC 350/450-R on-off solenoid control valve with surge prevention system.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 16 bar. Higher on request.
- Maximum temperature: 70°C.

### Solenoid electrical data

- Voltages: 24 V DC, 24 V/50 Hz, 230 V/50 Hz. Other voltages on request.
- Power consumption: inrush AC (VA) 24, hold AC (VA) 17 (8 W), DC hot/cold coil 8/9 W.

## Operating principle (for DN 150-600)

The CSA model XLC 350/450 is operated by a solenoid (5) working in combination with a flow accelerator or as a standalone unit, receiving impulses by remote or by a CSA controller, to perform either a fully closed or open function depending on what the valve is supposed to do in absence of power supply. The hydraulic accelerator (4) is present from DN 150 mm and above. In case of a normally open valve, for example, when the impulse is sent to the solenoid (5), the upstream pressure is diverted into the main chamber (10) directly, or through the hydraulic accelerator (4), pushing the obturator (11) towards the seat (12) then interrupting the supply. Should the signal be removed pressure will be taken out of the main chamber (10) directly or through the hydraulic accelerator (4), to lift the obturator (11) upwards then opening the main valve (9). Pressure in and out of the main chamber (10) is controlled by the CSA needle valve (2) needed for the valve's response avoiding possible surges and rapid pressure fluctuations. A filter (3) will protect the solenoid and the rest of the circuit from dirt.

## Installation layout

The picture shows the layout of the CSA XLC 350/450 linked to a CSA controller (4) or any other electronic device sending impulses. In this case an electric float (2) is used for water tank level regulation, according to the function required. Sectioning devices (1) are important for maintenance operations as well as a filter (3) to prevent dirt from entering the valve. Anti-surge combination air valves FOX 3F AS are recommended upstream of the installation for air release during operating conditions and pipe filling.

## On-off solenoid control battery operated flush valve Mod. XLC 350/450-P

The CSA Model XLC 350/450-P is a globe pattern hydraulically operated automatic control valve, normally closed, that opens in response to the signals supplied by a battery operated programmer, regardless of upstream pressure variations. The main function is to flush pipelines and/or to create water circulation by using up to three programs per day.

Normally equipped with visual position indicator and entirely made in ductile cast iron with FBT (fluid bed technology) epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage.

### Applications

- In derivation from main supply lines to create water circulation trough specific programs where power supply is not available.
- Installed in water distribution networks to flush and clean dead ends and segments with water in stagnant conditions.

### Accessories

- Pressure measurement kit.
- Self-flushing and high capacity filter.
- Box container for submerged application.
- CSFL mechanical flow regulator.

### Note to the engineer

- Inlet pressure, outlet pressure, flow rate and application are required for the proper sizing and cavitation analysis.
- Recommended flow rate and operating conditions on the XLC series engineering.
- Oversizing the valve may generate excessive pressure drop during opening, likely to prevent the valve from closing.

### Additional features

- XLC 350/450-P-FR on-off solenoid control valve with battery operated programmer and back-flow prevention system.
- XLC 350/450-P-R on-off solenoid control valve with battery operated programmer and surge prevention system.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 16 bar. Higher on request.
- Maximum temperature: 70°C.

### Battery operated programmer

- Make reference to the operating and installation manual provided with the valve.

## Operating principle (for DN 150-600)

CSA model XLC 350/450-P is controlled by a battery programmer sending impulses to the solenoid (5), to open the valve accordingly up to three programs per day. When the solenoid is activated by the programmer water is taken out of the main chamber (10) directly or through the accelerator (4), thus pushing the obturator (11) upwards and generating the full flow through the main valve (9). The hydraulic accelerator (4) is present for DN 150 mm and above. When another impulse is triggered by the programmer, at the end of the water supply cycle, pressure is diverted back towards the chamber (10) interrupting the flow.

Pressure in and out of the main chamber (10) is controlled by the CSA needle valve (2) needed for the valve's response avoiding possible surges and rapid pressure fluctuations. A filter (3) will protect the solenoid and the rest of components to prevent dirt from entering the mechanical assemblies.

## Installation layout

The picture shows the recommended layout of the CSA XLC 350/450-P, battery operated solenoid control valve used to flush pipelines, discharging directly into atmosphere or to the drainage system. Sectioning devices (1, 2) are important for maintenance operations as well as a filter (3) to prevent dirt from entering the valve. Anti-surge combination air valves FOX 3F AS (4) are recommended upstream to release air pockets in working conditions, and discharge large volumes of air during pipe filling and commissioning.

## Step by step solenoid control valve Mod. XLC 353/453

The CSA Model XLC 353/453 is a globe pattern hydraulically operated automatic control valve that modulates in response to signals applied to the solenoids valves. Thanks to CSA needle valves located on the circuit the reaction time of the opening and closing can be adjusted, independently one from the other, to ensure a smooth and accurate regulation. A manual emergency circuit is usually supplied with valve in case of power failure. Normally equipped with 4-20 mA position transmitter and made in ductile cast iron with FBT (fluid bed technology) epoxy coating and stainless steel, the valve reduces head loss, throttling noise and cavitation damage.

### Applications

- In combination with CSA controllers for pressure management and leakage reduction to regulate pressure versus flow.
- On the inlet supply line of storage tanks to perform level regulation and control.
- On the outlet supply line of storage tanks for flow control as a function of the water level.
- On heating and cooling systems to ensure flow control according to the temperature.

### Accessories

- Linear position transmitter Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.
- CSFL mechanical flow regulator.

### Note to the engineer

- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- Recommended flow rate and operating conditions on the XLC series engineering.
- The duration of impulses sent to the solenoid is important and changes with valve size and operating pressure.

### Additional features

- XLC 353/453-FR step by step solenoid control valve with back-flow prevention system.
- XLC 353/453-5 step by step solenoid valve with emergency opening system from remote.
- XLC 353/453-R step by step solenoid control valve with surge control system.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 1,5 bar.
- Maximum operating pressure: 16 bar. Higher on request.
- Maximum temperature: 70°C.

### Solenoid electrical data

- Voltages: 24 V DC, 24 V/50 Hz, 230 V/50 Hz. Other voltages on request.
- Power consumption: inrush AC (VA) 24, hold AC (VA) 17 (8 W), DC hot/cold coil 8/9 W.

## Operating principle

The model XLC 353/453 includes two solenoids (15-16) receiving impulses and acting on hydraulic accelerators (13-14), normally closed. Should a signal be sent to the upstream solenoid (15), the latter will allow some flow through (13) and towards the main chamber (10), in proportion to the numbers and duration of such impulses and controlled by the needle valve 6, throttling the passage between obturator (11) and seat (12). In the same way by using the downstream solenoid (16) water will be taken out of the main chamber, with flow and the opening speed controlled by the needle valve (7).

The main valve will therefore modulate in response to the signals sent to both solenoids.

The manual circuit (4-5) is always supplied, unless otherwise stated, and necessary to regulate the valve in case of power failure. A filter (3) will protect the solenoid and the rest of components to prevent dirt from entering the mechanical assemblies.

## Installation layout

In the picture the XLC 353/453 is installed in combination with a flow meter (5). A CSA controller (8) or other PLC units will constantly send impulses to the valve's solenoids to maintain the same flow regardless of pressure variations, or to manage the pressure according to variations in demand to reduce water loss and leakage. Sectioning devices (1, 2) and a by-pass, with CSA direct acting valves (4), are important for maintenance as well as a filter (3) and anti-surge air valves FOX 3F AS (6, 7) upstream and downstream.

## Booster pump automatic control valve Mod. XLC 390/490

The CSA Model XLC 390/490 is a globe pattern hydraulically operated automatic control valve, active check valve, that isolates the pump from the system during pump starting and stopping to prevent and avoid surges and water hammer events. The valve opens and closes in response to signals applied to the solenoid on the circuit where a needle valve will adjust the response time for an accurate and smooth regulation. Equipped with a limit switch activated by the position indicator's movement, made in ductile cast iron and stainless steel, the valve is designed to reduced head loss, throttling noise and cavitation damage.

### Applications

- At the pumps to enable start and stop cycles avoiding surges and water hammer.
- To prevent water hammer during pump switching in batteries and parallel operation.
- To ensure an accurate and surge free check prevention system.

### Accessories

- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- Recommended flow rate and operating conditions on the XLC series engineering.
- The duration of impulses sent to the solenoid is important and changes with valve size and operating pressure.

### Additional features

- XLC 491 booster pump pressure reducing valve.
- XLC 492 booster pump pressure sustaining control valve.
- XLC 493 booster pump with flow control valve.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 16 bar. Higher on request.
- Maximum temperature: 70°C.

### Solenoid electrical data

- Voltages: 24 V DC, 24 V/50 Hz, 230 V/50 Hz. Other voltages on request.
- Power consumption: inrush AC (VA) 24, hold AC (VA) 17 (8 W), DC hot/cold coil 8/9 W.

## Operating principle (for DN 150-600)

When pumps are turned off the valve (9) is closed and the solenoid (13) is de-energized. When the pump starts, the solenoid (13) is energized and the control chamber (10) is put in communication with the downstream pressure thanks to the hydraulic accelerator (7), thus pushing the obturator (11) upwards to generate a gradual increase of the flow rate.

The needle valve (3) ensures the regulation of the opening and closing speed, to avoid sudden variations in pressure. When shut down is required, the pump is kept running while the solenoid (13) is de-energized diverting, through the flow accelerator (7), the upstream pressure towards the control chamber (10) with gradual closing of the obturator (11) onto the seat (12). Once the indication rod (15) has reached a pre-determined position (adjustable, usually the 20% of the valve stroke), the limit switch (6) will send a signal for the pump to close. In case of power failure, the backflow through the main valve (9) is prevented thanks to the check valve (8) allowing the downstream pressure back to the control chamber (10) minimizing surges.

## Installation layout

The picture below shows the recommended installation layout of CSA XLC 390/490 (1) as an effective surge prevention system and protection device for water pumping stations, in combination with CSA pressure relief valves XLC model 420-R (2) or surge anticipating XLC model 421. Anti-slam combination air valves are recommended upstream (3) and downstream of the booster pump control as well as sectioning devices and bypass required for the proper maintenance.

## Booster pump control and pressure sustaining valve Mod. XLC 392/492

The CSA Model XLC 392/492 is a globe pattern hydraulically operated automatic control valve, active check valve, that will automatically sustain the upstream pressure and isolate the pump from the system during pump starting and stopping to avoid surges and water hammer events. The valve opens and closes in response to signals applied to the solenoid on the circuit where the exclusive CSA unit flow regulator GR.I.F.O will adjust the response time for an accurate and smooth regulation. Equipped with a limit switch activated by the position indicator's movement, the valve reduces head loss, throttling noise and cavitation damage.

### Applications

- At the pumps to enable start and stop cycles avoiding surges and water hammer maintaining a minimum upstream pressure.
- To prevent water hammer during pump switching in batteries and parallel operation.
- To ensure an accurate and surge free check prevention system.

### Accessories

- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- Recommended flow rate and operating conditions on the XLC series engineering.
- The duration of impulses sent to the solenoid is important and changes with valve size and operating pressure.

### Additional features

- XLC 491 booster pump pressure reducing valve.
- XLC 493 booster pump with flow control valve.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 16 bar.  
Higher on request.
- Maximum temperature: 70°C.

### Downstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.
- Values lower than 0,7 available with high sensitivity pilots.

### Solenoid electrical data

- Voltages: 24 V DC, 24 V/50 Hz, 230 V/50 Hz.  
Other voltages on request.
- Power consumption: inrush AC (VA) 24, hold AC (VA) 17 (8 W), DC hot/cold coil 8/9 W.

## Operating principle (for DN 150-800)

When the pump starts, should the upstream pressure be above the pilot set-point the solenoid (14) is energized with consequent opening of the auxiliary valve (13), which allows flow out of the main chamber (10) thus pushing the obturator (11) upwards to generate a gradual increase of the flow rate through the main valve. The upstream pressure sustaining pilot (5) will always maintain a minimum pre-set value to make sure the incoming pressure will never drop below it. When shut down is required, the pump is kept running while the solenoid (14) is de-energized closing the flow accelerator (13), diverting pressure towards the control chamber (10) with gradual closing of the obturator (11) onto the seat (12). Once the indication rod (17) has reached a pre-determined position (adjustable, usually the 20% of the valve stroke), the limit switch (8) will send a signal for the pump to close. In case of power failure, the backflow through the main valve (9) is prevented thanks to the check valve (15) allowing the downstream pressure back to the control chamber (10) minimizing surges.

## Installation layout

The picture below shows the recommended installation layout of CSA XLC 392/492 (1) as an effective surge prevention system and protection device for water pumping stations, in combination with CSA pressure relief valves XLC model 420-R (2) or surge anticipating XLC model 421. Anti-slam combination air valves are recommended upstream (3) and downstream of the booster pump control as well as sectioning devices and bypass required for the proper maintenance.

# Direct acting pressure reducing-stabilizing valve

## Mod. Microstab MRV

The Microstab MRV model is a two ways direct acting downstream pressure reducing-stabilizing valve. Diaphragm operated, the MRV will maintain an outlet pressure, preset and adjustable, to a fixed value regardless of variation of the upstream pressure and demand. This product is normally used for the regulation of XLC series and, due to its high sensitivity, accuracy and long lasting performances, as a stand-alone unit for water distribution systems, industrial installation, buildings. Supplied with a wide choice of optional materials and spring range, MRV is available with the versions PN 16, 25 and 40 bar on request with reinforced diaphragm.

N.	Component	Material
1	Body	nickel-plated bronze/st. steel
2	Cover	nickel-plated bronze/st. steel
3	Hood	stainless steel
4	Regulating screw	stainless steel
5	Nut	stainless steel
6	Spring guide	stainless steel
7	Spring	painted steel 52SiCrNi5/st. st.
8	Self-locking nut	stainless steel
9	Upper flat	stainless steel
10	Diaphragm	EPDM - Nylon
11	Obturator holder	stainless steel
12	Sealing seat	stainless steel
13	Gasket holder	stainless steel
14	Plane gasket	NBR
15	Tap	stainless steel
16	O-ring	NBR
17	Screw	stainless steel

The list of materials and components is subject to changes without notice.

### Working conditions

Treated water maximum 70°C.  
Minimum pressure: 0,5 bar in addition to head loss.  
Maximum pressure: 25 bar.  
Higher on request.

### Technical data

Kv equal to 0,82 m³/h.  
Recommended flow rate: 0,5 m³/h.  
Weight 1,55 Kg.  
Normally supplied with 3/8" F.

### Downstream pressure adjustment

Spring	Pressure range (bar)
blue	0,7 - 7
red	1,5 - 15

Higher values available on request.

### Standard

Design and testing in accordance with EN 1074.

# Direct acting pressure reducing-stabilizing valve

## Mod. Microstab MRV 2

The Microstab MRV 2 model is a two ways direct acting downstream pressure reducing-stabilizing valve with pressure sensing port. Diaphragm operated, the MRV 2 will maintain an outlet pressure, preset and adjustable, to a fixed value regardless of variation of the upstream pressure and demand. This product is normally used for the regulation of XLC series and, due to its high sensitivity, accuracy and long lasting performances, as a stand-alone unit for water distribution systems, industrial installation, buildings. Supplied with a wide choice of optional materials and spring range, MRV 2 is available with the PN 16 and 25 bar versions.

N.	Component	Material
1	Body	nickel-plated bronze/st. steel
2	Cover	nickel-plated bronze/st. steel
3	Hood	stainless steel
4	Regulating screw	stainless steel
5	Nut	stainless steel
6	Spring guide	stainless steel

### Working conditions

Treated water maximum 70°C.  
Minimum pressure: 0,5 bar in addition to head loss.  
Maximum pressure: 25 bar.  
Higher on request.

### Technical data

Kv equal to 0,82 m³/h.  
Recommended flow rate: 0,5 m³/h.  
Weight 2,25 Kg.  
Normally supplied with 3/8" F.

### Downstream pressure adjustment

Spring	Pressure range (bar)
blue	0,7 - 7
red	1,5 - 15

Higher values available on request.

### Standard

Design and testing in accordance with EN 1074.

# Direct acting pressure sustaining valve

## Mod. Microstab MSM

The Microstab MSM model is a two ways direct acting upstream pressure sustaining valve. Diaphragm operated, the MSM will maintain an inlet pressure, preset and adjustable, to a fixed value regardless of variation of the downstream pressure and demand. This product is normally used for the regulation of XLC series and, due to its high sensitivity accuracy and long lasting performances, as a stand-alone unit for water distribution systems, industrial installation, buildings. Supplied with a wide choice of optional materials and spring range, MSM is available with the versions PN 16, 25 and, on request, 40 bar with reinforced diaphragm.

N.	Component	Material
1	Body	nickel-plated bronze/st. steel
2	Cover	nickel-plated bronze/st. steel
3	Hood	stainless steel

### Working conditions

Treated water maximum 70°C.  
Minimum pressure: 0,5 bar in addition to head loss.  
Maximum pressure: 25 bar.  
Higher on request.

### Technical data

Kv equal to 0,9 m³/h.  
Recommended flow rate: 0,5 m³/h.  
Weight 2,23 Kg.  
Normally supplied with 3/8" F.

### Upstream pressure adjustment

Spring	Pressure range (bar)
blue	0,7 - 7
red	1,5 - 15

Higher values available on request.

### Standard

Design and testing in accordance with EN 1074.

## Direct acting quick pressure relief valve Mod. Microstab PSM

The Microstab PSM model is a two ways fast acting relief valve. Diaphragm operated, the PSM will discharge the excessive inlet pressure values, according to a preset and adjustable spring set point, regardless of variations of the downstream pressure and demand. This product is normally used for the regulation of XLC series and, due to its high sensitivity and accuracy and long lasting performances, as a stand-alone unit for water distribution systems, industrial installation, buildings. Supplied with a wide choice of optional materials and spring range, PSM is available with the PN 16 and 25 bar versions.

N.	Component	Material
1	Body	nickel-plated bronze/st. steel
2	Cover	nickel-plated bronze/st. steel
3	Hood	stainless steel
4	Regulating screw	stainless steel

16	O-ring	NBR
17	Gasket container	stainless steel
18	Gasket	NBR
19	Sealing seat	stainless steel
20	Screws	stainless steel

The list of materials and components is subject to changes without notice.

### Working conditions

Treated water maximum 70°C.  
Minimum pressure: 0,5 bar in addition to head loss.  
Maximum pressure: 25 bar.  
Higher on request.

### Technical data

Kv equal to 3,5 m³/h.  
Recommended flow rate: 2,1 m³/h.  
Weight 2,37 Kg.  
Normally supplied with 1/2" F.

### Relief pressure adjustment

Spring	Pressure range (bar)
blue	0,7 - 7
red	1,5 - 15

Higher values available on request.

### Standard

Design and testing in accordance with EN 1074.

## Flow control valve Mod. Microstab MLP

The Microstab MLP model is a two ways direct acting flow control valve. Diaphragm operated, the MLP will limit the maximum flow rate, preset and adjustable, to a fixed value regardless of upstream pressure variations where an additional adjustable assembly unit is required. This product is normally used for the regulation of XLC series and, due to its high sensitivity, accuracy and long lasting performances, as a stand-alone unit for water distribution systems, industrial installation, buildings. Supplied with a wide choice of optional materials, and available with the PN 16 and 25 bar version, MLP is provided with a flow rate regulation chart for on-site adjustments according to the compression of the spring.

N.	Component	Material
1	Body	nickel-plated bronze/st. steel
2	Cover	nickel-plated bronze/st. steel
3	Hood	stainless steel
4	Driving screw	stainless steel
5	Nut	stainless steel
6	Upper spring guide	stainless steel
7	Spring	stainless steel
8	Self-locking nut	stainless steel
9	Upper flat	stainless steel
10	Diaphragm	EPDM - Nylon
11	Obturator holder	stainless steel
12	Sealing seat	stainless steel
13	Gasket holder	stainless steel
14	Plane gasket	NBR
15	Tap	stainless steel
16	O-ring	NBR
17	Screw	stainless steel
18	Water tight spacer	stainless steel
19	O-ring	NBR
20	O-ring	NBR
21	Stop pin	stainless steel
22	Lower spring guide	stainless steel

The list of materials and components is subject to changes without notice.

### Note to the engineer

For the functioning an orifice plate assembly is required downstream, to generate the differential pressure necessary to balance the spring force inside the cover and sized according to the flow rate requirement.

### Technical data

Kv equal to 0,9 m<sup>3</sup>/h.  
Weight 1,65 Kg.  
Normally supplied with 3/8" F.

### Working conditions

Treated water maximum 70°C.  
Minimum pressure: 0,5 bar in addition to head loss.  
Maximum pressure: 16 bar.  
Higher on request.

### Standard

Design and testing in accordance with EN 1074.

# High sensitivity altitude/pressure reduction pilot Mod. Microstab MPZ

The Microstab MPZ model is a two ways direct acting modulating valve with remote sensing intermediate chamber. Diaphragm operated, the MRV will maintain a preset and adjustable tank level, whose static value is sensed through a dedicated pressure port, with an accurate and proportional modulating effect acting against the spring force located on the cover. This product is normally used for the regulation of XLC 470 control valves, designed for high sensitivity level control. Supplied with optional materials and different springs MPZ can also be used as independent altitude level/pressure reduction control valve.

N.	Component	Material
1	Body	nickel-plated bronze/st. steel

## Technical data

Kv equal to 0,82 m³/h.  
Weight 4,65 Kg.  
Normally supplied with 3/8" F.

## Standard

Design and testing in accordance with EN 1074.

## Two and three ways flow accelerators Mod. A2 and A3

The CSA hydraulic auxiliary valve, hydraulic relay, flow accelerator, is available in a two and three ways versions, namely A2 and A3, depending on the application and on the valve size for which it is required. This unit is a diaphragm actuated valve, operated in response to pressure applied to its control chamber, designed to be used on the circuits of the CSA XLC control valves series in order to enhance hydraulic capacity increasing at the same time performances and reliability. Used for a wide number of applications, the CSA A2 and A3 stand out for long lasting performances due to the choice of high quality materials and its design features.

## Visual position indicator Mod. CSPV

The CSA visual position indicator Mod. CSPV is designed to visually and easily display the valve position and regulation behaviour. The valve's indication rod shows the opening percentage of the internal mobile block, moving into a transparent tube with a solid stainless steel/nickel plated brass housing. The latter, open on two opposite sides for a clear vision, is provided with a manual air release system on top in order to allow air discharge during set up and maintenance. Supplied as a standard position indicator tool for CSA valves, the Mod. CSPV can be replaced by the linear 4-20 mA, on-off position transmitters or the mechanical flow regulator.

N.	Component	Material
1	Upper part	stainless steel
2	Lower part	stainless steel
3	Glass pipe	Pyrex glass
4	Rod	stainless steel

The list of materials and components is subject to changes without notice.

### Working conditions

Treated water maximum 70°C.  
Maximum pressure: 25 bar.

### Standard

Design and testing in  
accordance with EN 1074.

### Weight and dimensions

Valve DN	A (mm)	Weight (Kg)
from 50 to 125	82	0,23
from 150 to 250	110	0,27
from 300 to 600	175	0,36

# On-off position transmitter assembly

## Mod. CSPO

The CSA position indicator assembly model CSPO has been designed to be installed on every XLC control valves series with the purpose of providing on-off signals in relation to one or two points, normally corresponding to the opened and closed positions. The CSPO is operated by means of magnets fixed on the control valve's indication stem whose movement will provide the required signal when going through the sensing area of magnetic inductive proximity sensors, located on a bracket.

N.	Component	Material
1	Open valve proximity sensor	nickel-plated brass
2	Close valve proximity sensor	nickel-plated brass
3	Locking nuts	aluminium
4	Bracket	stainless steel
5	Stem	stainless steel
6	Sensor indicator disks	stainless steel
7	Screws	stainless steel
8	Guiding nut	stainless steel
9	Nut	stainless steel
10	Washer	stainless steel
11	Connecting screw	stainless steel
12	Stop pin	stainless steel

The list of materials and components is subject to changes without notice.

### Working conditions

Treated water maximum 70°C.  
Maximum pressure: 25 bar.

### Standard

Design and testing in accordance with EN 1074.

### Technical data

Power supply: 12-24 V DC.  
Protection: IP69, IP68.

# Contactless linear position transducer with magnetostrictive technology - Mod. CSPL

The linear position transmission system model CSPL has been designed to be installed on XLC control valves series with the purpose of providing a 4-20 mA output, in relation to the opening percentage. It is operated by means of a magnet fixed on the control valve's indication stem, whose movement will impart the required signal through a contactless technology. The CSPL is usually supplied with step by step or pressure management XLC control valve, although it can be assembled on any existing CSA valve simply by replacing few components.

N.	Component	Material
1	Position transducer	aluminium
2	Bracket	stainless steel
3	Bracket connections	aluminium
4	Screws	stainless steel
5	Magnet	stainless steel
6	Magnet support	stainless steel
7	Screws	stainless steel
8	Nuts	stainless steel
9	Screw	stainless steel
10	Stem	stainless steel
11	Guiding nut	stainless steel
12	Nut	stainless steel
13	Washer	stainless steel
14	Connecting screw	stainless steel
15	Mechanical stop pin	stainless steel

The list of materials and components is subject to changes without notice.

## Working conditions

Treated water maximum 70°C.  
Maximum pressure: 25 bar.

## Standard

Design and testing in accordance with EN 1074.

## Technical data

Power supply: 24 V DC  $\pm$  20%.  
Output signal: 4-20 mA.  
Protection: IP67.

## Three ways on-off level vertical float for minimum and maximum tank regulation - Mod. Rotoway

The CSA assembly for minimum and maximum level control, named Rotoway, is composed of a three ways body in stainless steel and all the accessories to provide a fully independent unit designed to operate on CSA control valves XLC series. Internals and construction details make Rotoway suitable for long operating cycles also in presence of high differential pressure, with the level control regulation range up to 4 m length. The operating principle is based upon the movement of the float that, sliding on a wire, imparts the force to the lever to switch from open to the closed positions, by means of mechanical stops corresponding to the minimum and maximum level of the tank, both pre-set and adjustable.

N.	Component	Material
1	Rotoway pilot	stainless steel, bronze, Delrin
2	Bracket	stainless steel
3	Rod	stainless steel
4	Counterweight	stainless steel
5	Wire	stainless steel
6	Stop collars	stainless steel
7	Float	stainless steel
8	Counterweight	stainless steel

The list of materials and components is subject to changes without notice.

### Front view

The picture shows the front view of the three ways Rotoway case, the screws in the middle is used to adjust and balance the lever linked to the float mechanism.

### Rear view

The picture shows the rear view of the three ways Rotoway case with pressure port connections, S for drain, C for chamber and M for upstream, used to operate the CSA XLC control valves according to the set up and installation manual.

### Working conditions

Treated water maximum 70°C.  
Design pressure: 16 bar.  
Recommended working pressure: 6 bar.  
Higher on request.

### Standard

Design and testing in accordance with EN 1074.

### Technical data

Normally supplied with 1/8" F.

### Installation

The Rotoway assembly is usually located on top of water level inside the main reservoir, although it can be installed in a stilling tank for better performances and maintenance purposes. The picture on the right shows the recommended size of the pipe, required for such application.

## Two ways modulating proportional constant level control pilot - Mod. MCP

The CSA MCP is a two ways proportional modulating float valve, designed to maintain the constant level of a tank regardless of upstream pressure variations. This product, entirely made in stainless steel and created for the regulation of CSA level control valves XLC series, thanks to its high accuracy and reliability can also be used as a stand-alone unit for water distribution systems, industrial installations, buildings. MCP is actuated by a float, sensing the water level of the tank, and whose variation will impart a force to the lever to which it is connected in order to move the piston horizontally and modulate the flow passage between the seat and the obturator proportionally to the consumption.

N.	Component	Material
1	Body	stainless steel
2	Seat	stainless steel
3	Obturator	stainless steel
4	Plane gasket	NBR
5	Tap	stainless steel
6	Spring	stainless steel
7	Lever	stainless steel
8	Pivot	stainless steel
9	Rod	stainless steel
10	Screws	stainless steel
11	Nuts	stainless steel
12	Float	stainless steel
13	Screw	stainless steel

The list of materials and components is subject to changes without notice.

### Working conditions

Treated water maximum 70°C.  
Design pressure: 16 bar.  
Recommended working pressure: 6 bar.  
Higher values on request.

### Standard

Design and testing in accordance with EN 1074.

### Technical data

Kv: 0,67 m<sup>3</sup>/h.  
Stroke of the float: 85 mm, different on request.

## On-off limit switch assembly Mod. CSLS

The CSA limit switch assembly CSLS has been designed to be installed on every XLC control valves series with the purpose of providing on-off signals in relation to the position. The activation point is given by the disk acting on the limit switch, adjustable to the required position. The entire assembly is located on a bracket in stainless steel holding the water tight nut threaded on the chamber while the stem is connected to the main shaft, by means of a bearing pin to allow for tolerance and unwanted friction during movement.

N.	Component	Material
1	Switch	steel/stainless steel
2	Bracket	stainless steel
3	Stem	stainless steel
4	Indicator disk	stainless steel
5	Screw	stainless steel
6	Guiding nut	stainless steel
7	Nut	stainless steel
8	Washer	stainless steel
9	O-ring	NBR
10	Connecting screw	stainless steel
11	Stop pin	stainless steel

The list of materials and components is subject to changes without notice.

### Technical data

Protection: IP67.

Metal case.

Different executions and more information on request.

### Standard

According to EN 60947-5-1, EN 60947-1, EN 60204-1, EN ISO 14119, EN ISO 12100, EN 60529.

## Mechanical flow regulator Mod. CSFL

The CSA mechanical flow regulator Mod. CSFL is designed for the manual control of the maximum opening percentage of the valve in working conditions. Entirely made in stainless steel this accessory can be installed on every model of CSA XLC series control valve, and replace existing position indicators, output signal and any other CSA solutions located on top of the control chamber. The CSFL is mostly recommended for surge anticipation valves, surge relief, level control and whenever the possibility of the manual adjustment of the maximum flow may be needed for the proper regulation of the valve and the safety of the system.

N.	Component	Material
1	Body	stainless steel
2	Regulating screw	stainless steel
3	O-ring	NBR/EPDM/Viton
4	O-ring	NBR/EPDM/Viton
5	Stop pin	stainless steel

The list of materials and components is subject to changes without notice.

### Working conditions

Treated water maximum 70°C.  
Maximum pressure: 25 bar.  
Higher values on request.

### Dimensions

Valve DN (mm)	A max. (mm)	B (mm)	C (mm)
50-65	95	CH24	CH8
80-100	121	CH30	CH10
150-200	199	CH42	CH15

Bigger sizes available on request.

### Standard

Design and testing in  
accordance with EN 1074.

## XLC 400 - Standard version - Technical data

DN (mm)	40	50	65	80	100	150	200	250	300	400	600
Kv (m³/h)	40,6	40,6	68	126	169	410	662	1126	1504	2675	5544
Stroke (mm)	15	15	18	21	27	43	56	70	84	110	162

### Head loss coefficient

Kv coefficient representing the flow rate which is flowing through the valve fully open, and producing a head loss of 1 bar.

### Cavitation chart

The cavitation analysis is very important since it may lead to substantial damages, in addition to vibration and noise. The cavitation chart has to be used to determine whether the working point obtained by the intersection of the lines, connecting upstream (y axis) and downstream (x axis) pressure conditions, lies within one of the 3 zones to be identified as follows:

- A: Recommended working conditions;
- B: Noise cavitation;
- C: Damage cavitation.

The chart is to be used for valves modulating with an opening percentage between 35-40% at standard water temperature and elevation below 300 m. For continuous pressure reduction the maximum allowed  $\Delta p$  shall not exceed 15 bar.

### Head loss chart

The chart indicates the head loss of XLC 400 automatic control valves fully open versus flow rate in l/s.

### Recommended flow rate

The following chart shows the recommended flow rate for the proper sizing of XLC 400 control valves.

DN (mm)			40/50	65	80	100	150	200	250	300	400	600
Flow rate (l/s)	Recommended	Min.	1	1,7	2,5	3,9	8,8	16	25	35	63	132
		Max.	9,8	17	25	39	88	157	245	353	628	1413
	Pressure relief	Max.	15	25	38	59	132	235	368	530	942	1978

All values are approximate, consult CSA service for more details.

### Cavitation chart

The cavitation analysis is very important since it may lead to substantial damages, in addition to vibration and noise. The cavitation chart has to be used to determine whether the working point obtained by the intersection of the lines, connecting upstream (y axis) and downstream (x axis) pressure conditions, lies within one of the 3 zones to be identified as follows:

- A: Recommended working conditions;
- B: Noise cavitation;
- C: Damage cavitation.

The chart is to be used for valves modulating with an opening percentage between 35-40% at standard water temperature and elevation below 300 m. For continuous pressure reduction the maximum allowed  $\Delta p$  shall not exceed 15 bar.

### Head loss chart

The chart indicates the head loss of XLC 400-AC automatic control valves fully open versus flow rate in l/s.

### Recommended flow rate

The following chart shows the recommended flow rate for the proper sizing of XLC 400-AC control valves.

DN (mm)			40/50	65	80	100	150	200	250	300	400	600
Flow rate (l/s)	Recommended	Min.	0,5	0,9	1,4	2,2	4,9	8,8	14	20	35	71
		Max.	7,9	14	19	30	67	124	188	274	496	1130
	Pressure relief		Max.	12	20	30	46	100	185	283	412	744

The technical informations are indicative and can change according to the number and dimension of the slots.

## XLC 400 - CP anti-cavitation version - Technical details

## XLC 300 - Standard and anti-cavitation versions - Spare parts breakdown

## Double chamber control valves XLC DC series

The CSA XLC double chamber DC series, applicable for the full bore and reduced bore versions, consist of a globe pattern hydraulically operated automatic control valve. The intermediate chamber, in communication with the atmosphere or pressurized, separates the upper cover from the lower part with a diaphragm PN 25 bar class. The valve works with lower differential pressure with a faster response, both aspects extremely useful in special applications like pump control and proportional downstream pressure reduction. Low flow stability and anti-cavitation cages are available on request prior to sizing.

### Technical features

#### Standard version of mobile block and sealing seat

1. Gasket holder in stainless steel
2. Seat in stainless steel

#### AC version for low flow stability and cavitation prevention

1. Gasket holder for low flow and cavitation prevention
2. Seat in stainless steel

#### CP double cage anti-cavitation version

1. CP anti-cavitation gasket holder
2. CP anti-cavitation seat in stainless steel

The standard gasket holder guarantees the maximum accuracy also for low flow and small opening. The shaft of the mobile block is guided in two points, through the cover and the guide on the intermediate chamber, moving frictionless during modulation. The anti-cavitation trim AC mobile block includes a gasket holder designed to increase the allowable pressure ratio and resistance to cavitation, improving at the same time the valve's stability to guarantee the maximum accuracy also in case of no flow. The CP system includes two cages for double energy dissipation between inlet and outlet, obtained by the gasket holder and seat moving one inside the other, whose holes can be customized according to the project in hand and required performances, this is to avoid damages to the valve without a drastic reduction of the valve's Kv.

## Operating principle modulating mode - proportional pressure reduction

### Valve modulating

Due to the difference in surface between the upper flat of the control chamber and the obturator, the double chamber valve will keep modulating in case of water supply. That allows the regulation of the downstream value based on fixed ratio between inlet outlet, with the mobile block opening percentage changing according to the upstream pressure variations. The pressure ratio can be modified on request.

### Valve closed in static conditions

In case of static condition the downstream pressure is entirely applied on the upper control chamber through the hydraulic circuit (equipped with strainer and needle valve). That generates to different forces whose values are proportional to the surfaces, in particular the area of the diaphragm flat being wider than the one of the obturator causes a higher value pushing downwards with a drip tight closure of the valve.

## Operating principle on-off mode - remote control

### Valve opening

The intermediate and upper chambers can be put in communication with the pressure source to allow for the on-off mode. In particular the picture shows the application with solenoid valves applied on CSA 3 ways hydraulic relays, should the intermediate chamber be pressurized the force will act on the entire surface of the diaphragm flat causing the full opening of the valve.

### Valve closing

Should the pressure be applied on the upper chamber, while the intermediate is discharged through the hydraulic relay, the valve obturator will be pushed down causing the closure of the valve. The needle valves are present on the communication circuits for both chambers and needed for the regulation to avoid unwanted pressure surges.

## Double chamber proportional pressure reducing valve **XLC 300/400-DC-PR**

The CSA double chamber proportional pressure reducing valve is a globe pattern hydraulically operated automatic control valve that, installed in-line, will reduce and stabilize the upstream pressure to a lower downstream value according to a fixed ratio. Equipped with double chamber technology the valve is extremely reactive, increasing the safety and reliability of the line. Produced in compliance with PN 16/25 bar pressure standards and entirely made in ductile cast iron FBT epoxy painted and stainless steel, the valve is provided with anti-cavitation low flow stability system.

### Applications

- To perform a double pressure reduction stage in combination with other CSA reducing control valves.
- The valve is used on the inlet supply line of storage tanks to stabilize pressure upstream of CSA valves for level control either mechanical or pilot operated.
- On gravity fed supply lines and long downhill slopes to dissipate high differences in elevation, with multiple installations.

### Accessories

- Pressure measurement kit.
- Self-flushing and high capacity filter.
- Mechanical flow limiter.
- Double cage CP for high differential pressures and reduced noise.

### Note to the engineer

- Inlet and outlet pressure, and flow rate are required for the proper sizing.
- A minimum length of 3 DN downstream of the valve is recommended for the best accuracy.
- The downstream pressure will change depending on the inlet pressure and following a fixed ratio.

### Additional features

- XLC 300/400-DC-PR-FR double chamber proportional pressure reducing valve with back-flow prevention.
- XLC 300/400-DC-PR-5 double chamber proportional pressure reducing valve with solenoid control.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 25 bar.
- Maximum temperature: 70°C.

## Operating principle

The CSA Model XLC 300/400-DC-PR is an automatic control valve with double chamber technology, operated by means of the downstream pressure force (1) acting on the upper part of the control chamber (6) that separates the lower part with fluid flow from the intermediate chamber (7), in communication with the atmosphere. Due to the difference between the areas of the seal disks of the upper chamber (10) and the obturator (8), the valve will reduce the upstream pressure following a fixed ratio even in static conditions. This is due to the net force resulting from the downstream pressure acting on two difference surfaces.

The AC system (11) the valve is equipped with, allows for low flow stability and a higher resistance to cavitation compared with the standard design.

The flow in and out of the upper control chamber is regulated by the CSA high sensitivity needle valve (2) in stainless steel, needed to regulate the response time of the valve and to guarantee accuracy also in case of rapid variation in demand.

## Installation layout

The installation lay-out of the XLC 300/400-DC-PR, in combination with a downstream pilot operated pressure stabilizing control valve XLC 310/410, includes sectioning devices and by-pass for maintenance operations along with a filter to prevent dirt from reaching the control valves. Anti-surge combination air valves FOX 3F AS are recommended upstream and downstream of the installation, as well as direct acting pressure relief models VSM between the two pressure reducing units and further downstream.

## Double chamber downstream pressure reducing stabilizing valve Mod. XLC 310/410-DC

The CSA model XLC 310/410-DC is a globe pattern hydraulically operated automatic control valve that reduces and stabilizes the downstream pressure to a constant value, regardless of variation in demands and upstream pressure conditions. Normally equipped with visual position indicator and entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage. The CSA pressure reducing stabilizing valve XLC 310/410-DC is extremely versatile and can be used for a wide range of applications.

### Applications

- Downstream of pumps to reduce the pressure on the main supply line.
- Installed in derivation from the main line to stabilize the pressure of secondary line and water users.
- As a protection against rise in pressure of industrial equipment and civil installations.
- On the inlet supply line of storage tanks to stabilize pressure and flow required for the level control.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet and outlet pressure, and flow rate are required for the proper sizing.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- A minimum length of 3 DN downstream of the valve is recommended for the best accuracy.

### Additional features

- XLC 310/410-DC-FR downstream pressure reducing with back-flow prevention.
- XLC 310/410-DC-H downstream pressure reducing with high sensitivity pilot.
- XLC 310/410-DC-G downstream pressure reducing with over pressure guard.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 25 bar.
- Maximum temperature: 70°C.

### Downstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.
- Higher values up to 25 bar on request.
- Values lower than 0,7 available with high sensitivity pilots.

## Operating principle

The CSA model XLC 310/410-DC is an automatic control valve operated by a 2 ways pilot (5) with pre-set set and adjustable value. Should the downstream pressure rise above the pilot set point the latter will throttle and limit the flow to direct inlet pressure to the main chamber (10), thus pushing down the obturator (11) to generate the head loss required for the valve (9) to reduce and stabilize the downstream pressure to a constant value. Should the downstream pressure fall below the pilot set point the obturator (11) will raise increasing the passage through the seat (12), thus reducing the head loss followed by the rise in pressure. The flow in and out of the main chamber (10) is controlled by the CSA unit regulation device with filter GR.I.F.O. (4) provided with three needle valves and flow stabilizers, needed for the valve's response time and accuracy also in case of rapid variation in demand. Thanks to the isolation ball valves (1-2-3) the control circuit and its components can be maintained without interrupting the flow through the main line.

## Installation layout

The XLC 310/410-DC installation lay-out includes sectioning devices (1, 2) and by-pass for maintenance operations, and a filter (3) to prevent dirt from reaching the control valve. The direct acting pressure reducer VRCD (4) is the best choice on the by-pass thanks to its reliability also after long periods of inactivity. Anti-surge combination air valves FOX 3F AS (6, 7) are recommended upstream and downstream as well as a pressure relief valve VSM (5) to prevent rise in pressure on the main line.

## Double chamber upstream pressure sustaining valve Mod. XLC 320/420-S-DC

The CSA Model XLC 320/420-S-DC is a globe pattern hydraulically operated automatic control valve that, installed in-line, will sustain the upstream pressure to a pre-set and adjustable value regardless of variations in demand. Normally equipped with visual position indicator and entirely made in ductile cast iron with FBT epoxy coating and stainless steel, the valve is designed to reduce head loss, throttling noise and cavitation damage. The XLC 320/420-S-DC is extremely versatile and can be used for a wide range of applications in combination with several CSA accessories and additional functions.

### Applications

- Downstream of pumps to prevent overload and for cavitation protection.
- On the inlet supply line of storage tanks to stabilize pressure and flow required for the level control.
- On gravity fed supply lines to ensure the minimum pressure to consumers located at higher elevation zones, in case of high consumption of the lower zones.

### Accessories

- Linear position transmitter with 4-20 mA output Mod. CSA CSPL.
- On-off position transmitter Mod. CSA CSPO.
- Pressure measurement kit.
- Self-flushing and high capacity filter.

### Note to the engineer

- Inlet pressure, outlet pressure, flow rate and application are required for the proper sizing and cavitation analysis.
- CSA anti-cavitation low flow stability plugs are recommended to provide an accurate regulation in case of low flow conditions.
- A minimum length of 3 DN upstream of the valve is recommended for the best accuracy.

### Additional features

- XLC 320/420-S-DC-FR pressure sustaining valve with back-flow prevention.
- XLC 320/420-S-DC-5 pressure sustaining valve with solenoid control.
- XLC 320/420-S-DC-H pressure sustaining valve with high sensitivity pilot.

### Working conditions

- Fluid: treated water.
- Minimum operating pressure: 0,7 bar.
- Maximum operating pressure: 25 bar.
- Maximum temperature: 70°C.

### Upstream pressure pilot adjustment range

- Blue spring: 0,7 to 7 bar.
- Red spring: 1,5 to 15 bar.
- Higher values up to 25 bar on request.

## Operating principle

The CSA Model XLC 320/420-S-DC is an automatic control valve operated by a high sensitivity two ways pilot (5), with pre-set and adjustable set point value, sensing the upstream pressure from the GR.I.F.O. (4). Should the line pressure rise above the pilot's set point the latter will open thus relieving the chamber (10) and moving the obturator (11) upwards, to discharge water and pressure through the main valve (9) downstream protecting the system. Should the upstream pressure be lower than the pilot's set point the latter will throttle (close eventually) diverting all pressure towards the main chamber (10) thus pushing the obturator (11) onto the seat (12), interrupting the flow rate.

The flow in and out of the main chamber is controlled by the CSA exclusive unit flow GR.I.F.O. (4) providing accuracy and absence of unwanted chattering.

## Installation layout

The recommended installation lay-out of the CSA XLC 320/420-S-DC, used as a pressure sustain in-line, includes sectioning devices (1, 2) and by-pass for maintenance operations, and a filter (3) to prevent dirt from reaching the control valve. The direct acting pressure sustain valve CSA Mod. VSM (4) is the best choice on the by-pass thanks to its reliability also after long periods of inactivity. Anti-surge combination air valves CSA Mod. FOX 3F AS (5, 6) are recommended upstream and downstream of the installation.

## XLC DC - Standard version - Technical details

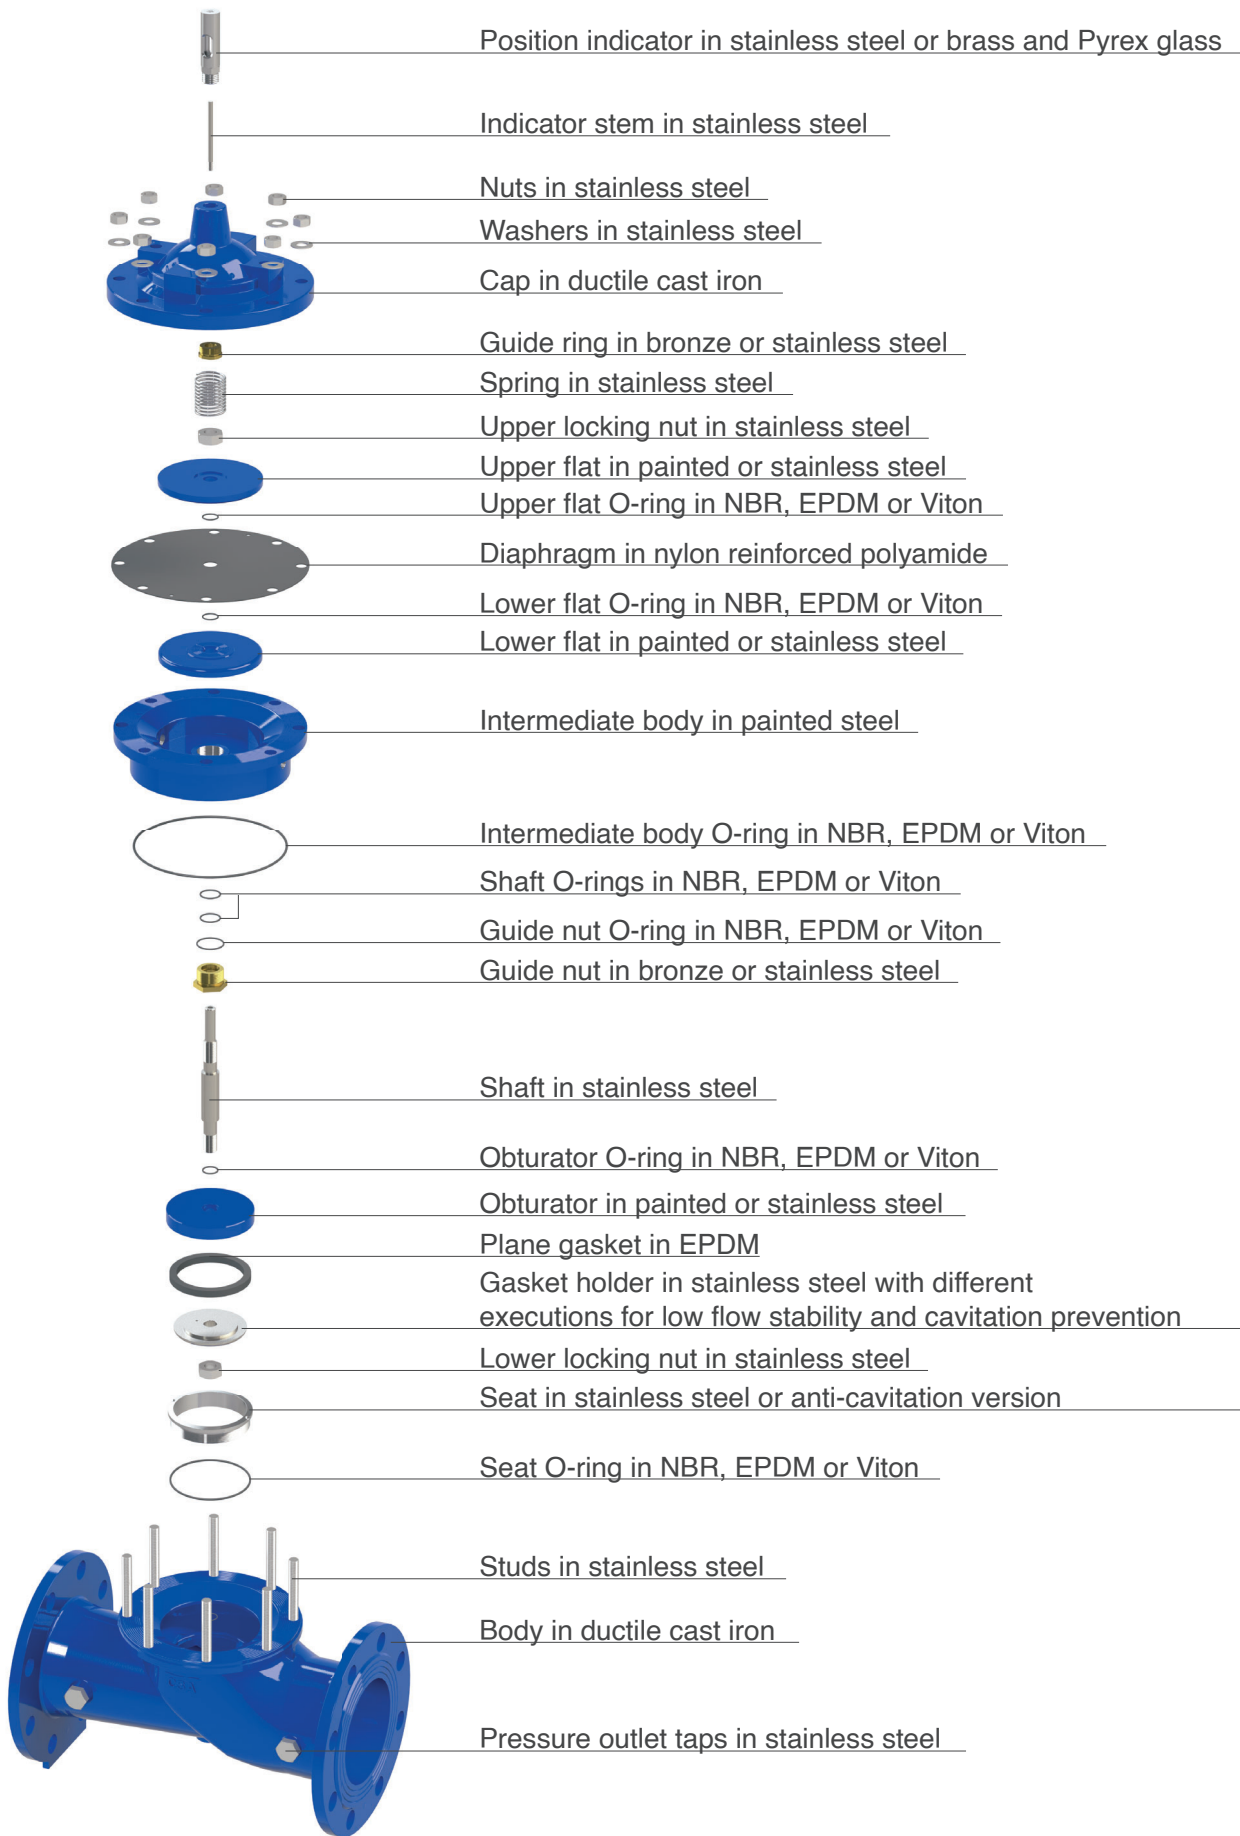

N.	Component	Standard material	Optional
1	Body	ductile cast iron GJS 500-7 or GJS 450-10	
2	Cap	ductile cast iron GJS 500-7 or GJS 450-10	
3	Position indicator	stainless steel AISI 303	
4	Pressure outlet taps	stainless steel AISI 316	
5	O-rings	NBR	EPDM/Viton
6	Intermediate body	painted steel	cast iron GJS 450-10
7	Indicator stem	stainless steel AISI 303	stainless steel AISI 316
8	Main shaft	stainless steel AISI 303	stainless steel AISI 316
9	Guide ring	bronze CuSn5Zn5Pb5	stainless s. AISI 303/316
10	Spring	stainless steel AISI 302	
11	Upper and lower locking nuts	stainless steel AISI 304	stainless steel AISI 316
12	Upper and lower flats	painted steel	stainless s. AISI 304/316
13	Diaphragm	polyamide-Nylon	neoprene/EPDM-Nylon
14	Obturator	painted steel	stainless s. AISI 304/316
15	Plane gasket	NBR	
16	Gasket holder	stainless steel AISI 303 (304 from DN 150)	stainless steel AISI 316
17	Seat	stainless steel AISI 303 (316 from DN 150)	stainless steel AISI 316
18	Seat O-ring	NBR	EPDM/Viton
19	Studs, nuts and washers	stainless steel AISI 304	stainless steel AISI 316
20	Intermediate body O-ring	NBR	EPDM/Viton
21	Guide screw	bronze CuSn5Zn5Pb5	stainless s. AISI 303/316
22	O-rings	NBR	EPDM/Viton
23	O-ring	NBR	EPDM/Viton

### Advanced testing facilities

Designed to reproduce real conditions of modern water distribution systems the CSA testing facility is able to assess the dynamic performances of automatic control valves, direct acting pressure control valves, air valves and anti water hammer valves.

Provided with a high capacity booster pumps station, and linked to an advanced high frequency pressure transducers and flow meters, the testing rig allows for a real time visualization of pressure and flow evolutions. Water hammer events can also be simulated and recorded to prove the efficacy of CSA fast acting relief valve, in addition to level control for which, using an auxiliary stilling tank, a part of the pipeline system is entirely dedicated.

The PLC and control station allows for the operation of step by step and solenoid operated valves to determine the sensitivity of such kind of application and pressure management solutions. Thanks to this important and powerful tool valves can be customized, simulated and set according to the project requirements assuring the perfect performance and accuracy.

### The testing process

All our valves undergo severe tests according to EN standards to ensure they are mechanically resistant, watertight, and high performing. After testing every valve is identified by means of a metallic tag or sticker, and duly registered and certified.

## CSA HYCONSULT

### Water hammer analysis CSA Hyconsult

CSA Hyconsult was founded to provide designers and consultants, involved in the design of water distribution and sewage systems, with accurate and unique technical support.

CSA Hyconsult has specialized in hydraulic modelling and transients analysis, entirely through the use of modern computational tools and advanced algorithms. Simulations are essential to predict system responses to events under a wide range of conditions without disrupting the actual system.

Using simulations, problems can be anticipated in possible or existing situations, and solutions can be evaluated in order to invest time, money and material in the most productive manner.

### Research and innovation

CSA has always regarded knowledge as being indispensable for the kind of research that consistently feeds innovation at all levels. The R&D department at CSA constantly strives to improve product performance and continually searches for new solutions to meet our customer's needs. Twenty years of experience in valve design and sizing, supported by advanced computational tools, cooperation with external entities at the highest level, and test facilities for the verification of theoretical results which are available for our customers, guarantee our professionalism and reliability.
